3. Use the M/ch knob to set the memory chanel you want.

4. Press the BAND switch, That is the button in the upper right hand conor
of the rig, or the lower conor. Use either one. Numbers should appear.
Set it to the correct band. Then use the main knob to set the frequency.
Use the other bottons to set the tone and offset or whatever you want to
store in the memory.

5. Press the MW button for about 2 seconds to store in memory.

If I might make a suggestion ...

Rather than using a concrete sidewalk (that is rough and likely
to mar the plastic), how about some other, *smooth*, hard
surface?

Does anyone know where I can find a free download of the Yaesu FL-101 manual? It's not available through the Bama site. Any ideas would be appreciated.

73 es thanks - John - WA9WHD

2012. Icom 746 vs 746PRO

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-23 17:44:36 UTC
From: Tom <trg46@charter.net>
Message-ID: <v5i23sgpd99l01@corp.supernews.com>
Source record: 33044

I am interested to know from anyones experience, what how the 2 receivers differ from the original 746 to the 746PRO. I have read reviews -- looked at 746 groups on Yahoo - but really havent seen any comments as to the difference in receivers??? Are they basicly the same??? is the PRO receiver redesigned and sounds better than the original 746???

any comments would be great - Thanks

Point of history: Hitler was NOT elected by a "majority of Germans." In the July 1932 election he got 37.3%. Hitler became chancellor of Germany in January of 1933 after some backroom deals. After the Reichstag was burned down Hitler took dictatorial powers, closed down many newspapers that supported opposition candidated and had some candidates murdered. Certain opposition parties such as the German Communist Party were outlawed and their members put into concentration camps.

Large corporations were "shaken down" for contributions to the NAZI party's campaign war-chest.

Even with these measures to skew the election process Hitler still got only 43.9% of the vote in the general election of 1933.

Hi,

Anyone can suggest the best automatic antenna switch that makes it possible to connect a transmitter module and receiver module together, to form a transceiver for bi-directional half duplex communications?

I would use it to receive with Drake R8B and transmitt with classic rig.

Steve

Bought the wife a new car - Buick Rendezvous AWD. She want her 2-meter rig installed. OK no problem here - but.... I don't really want to drill holes unless I really need to.

I have used thru the glass antennas before and they worked OK here around town and for a little simplex.

Now comes all the darkened glass on the car. I have used thru the glass on dark windows before, but am now told the new glass does not pass RF.

Any thoughts?

Bill W2BLC

Ask your dealer if it is passivated glass (metal particles), they may have
to look that one up!
But radio shack had a note on this, that the passivated glass windshields
woul create problems for glass mount antennas

Source record: 32958

Keep in mind that the Alinco (I have a 600T) does crossband, but it is a Simplex operation only: unless they have made somd changes on the 605, you can speak on 2M and transmit on 450, or vice versa, but you cannot work a repeater on 2M for example by using a 450 HT in... there's no provision for the necessary transmit offset.

This limits the usefulness of the feature, but does allow someone with a monoband HT to work those with monoband HTs on the other frequency.

It can also be used as a repeater "extender". Our club repeater has
inputs on 2M and 70cm, and outputs on 2M.

For a public service event, Tom parked his truck at a central location
and left the crossband repeating mobile unit on. It took the input 2M
frequency and repeated it, with 50W, on the 70 cm input frequency. In
this way, we could use low power 2M HTs while walking along the parade
route, and knowing that we would get a good signal into the repeater.
An HT could easily receive the repeater clearly.

Tom is one of the trustees on our repeater, so he is one of the people
who programmed it and best understands how it is linked.

Setting up like this could make sense in a number of emergency
operations as well, which is one of the reasons we do public service
events. Practice, practice, practice, train and hope that we never
have to do the real deal (but if we do we'll be ready).

Happy trails,
Gary (net.yogi.bear)

2028. FS: Autek receiver audio filter QF-1

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-24 01:16:31 UTC
From: "Dr. Phil" <robert931@sympatico.ca>
Message-ID: <Qne6a.697$VG.145442@news20.bellglobal.com>
Source record: 32960

This is an audio receive filter and has functions Peak, Notch and Lowpass.
These functions are all adjustable via the frequency and selectivity knobs.
This unit greatly reduces noise on your receiver. Not DSP, it's an analog
filter.

Asking $20USD plus shipping.
Contact: valveman_6146@yahoo.com
Cheers,
Robert

Got in on this post a bit late. Does your Kenwood use the RJ
telephone-style connector? My Yaesu FT-1500 manual shows the use of two
wires of a section of phone cable going from one radio to another to
clone the programming using the PTT and ground connectors.

The mike connector on my FT-1500 shows:
Pin 1: Sw 2 [Multifunction Switching]
Pin 2: Sw1 [Multi-function Switching]
Pin 3: +9V
Pin 4: GND
Pin 5: Microphone Input
Pin 6: PTT [clone]

Radio one 6 4 Radio two
4 6

2033. Icom 765 Service

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-24 03:14:39 UTC
From: "Thomas L. Gaines, Sr." <gaines45@bellsouth.net>
Message-ID: <S_f6a.1041$li6.706@fe07.atl2.webusenet.com>
Source record: 32965

I need opinions on the best independent service operation for Icom radios outside of the company (Icom). I have an Icom 765 which needs service and is considered a boatanchor in some quarters. I sent it into Icom to correct an intermittant problem in one of the VCOs which cause frequency drift (about (500 hz). I sent my rig in with a letter to Icom with copies of their web page which decribes the problem and the fix. My radio came back with a work order which ignored the problem and other things done to it and a big bill + a new problem inserted into the rig which did not exist before.

I am not in the marker for a new $3000.00+ rig.

I need competent service.

Any Ideas?

Sounds more like Alternator noise to me Rudi,

You may try unpluging the modular plug on the side of the alternator (if it has one) the small guage wires, or otherwise disabling it (use a schematic) and see if that makes a difference.
Alternately loading the alternator with the heater, headlights, defroster or other accessories should change the sound in the receiver if the alternator is infact producing the hash.
Alternator noise is usually high in frequency fine random buzzing that follows the engine RPMs. Ignition noise is usually coarser in nature, also following the engine RPM.

Good luck.

Many new cars (our Honda Accord is one) have a place in the back window especially designed for a thru-glass antenna. You can usually spot it by an open area where there are no heating wires for the rear window defrost. In our Honda it is very obvious. The new Cadillac we rode in tonight has a place in the back window for the OnStar antenna.

Hi Tom:

The ARRL 746 Pro product review does a side-by-side comparison of the 2 rigs. If you are a member, its a free download. Likewise, easy to download product and expanded lab tests for both. Look at receiver performance and nice in that both rigs checked with NIST traceable standards instruments using the same method.

There are more than 140 WWW based reviews of both rigs by users.
http://www.eham.net/reviews/products/14

You can look at the Icom Email Reflector archives at
http://mailman.qth.net/pipermail/icom/

and gain some insights such as....
Some reviewers have stated that the 756Pro2 has somewhat better receiver "numbers" than the 746Pro. Here is a link to a discussion of this:
http://www.archi.is.tohoku.ac.jp/~ooba/ja7ude/index.html

Dave,

I've performed it on the 440's and 850's so I don't see why it wouldn't.
Simply a case of placing the tuner in line BEFORE the transmit receive
relay. Works FB on my 850.

Max

Dean,

Thd tm-707a uses a 6 pin din connector for both the cloning and for
the software programming interface.

I'm not sure how useful it'll be to me until I understand more about
the radio and the niceties of programming it. I'm new to VHF and UHF.

I guess it couldn't be too much of a pain to take it out of the car
and bring it inside for any reprogramming that's too involved to do
conveniently in the car.

Haven't bought one myself, yet but many folks in sci.geo.satellite-nav
think well of them for holding GPS units in cars, on motorcycles and
boats.

It's a modular system, which might be helpful for either multiple
vehicles or multiple gadgets.

2053. GMRS remote antenna

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-25 04:07:33 UTC
From: "Gary S." <Idontwantspam@net>
Message-ID: <02nl5v49jo1kvsd3ks9gtrut9go237h987@4ax.com>
Source record: 32986
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.equipment

This is related to GMRS, but these groups seem relevant.

Our town's Emergency Operations Center (EOC) and radio room are
located in a basement (former bomb shelter IIRC) and the various ham
and public frequency antennas are on the third floor roof, as
reception in the basement is almost zero.

One thought we had discussed is that to supplement the hams, having
other people with shorter range GMRS and even FRS radios in various
parts of the town as part of an overall emergency communications
strategy would make sense.

Part of this set-up would be to have a GMRS radio mounted in the radio
room, but then we would need a remote antenna on the roof.

I have found a mag mount antenna for GMRS, but without even
calculating, figure that a two watt GMRS signal would be useless over
such a long run of coax, and that the input signal might also be
attenuated too much.

Any ideas on how to do this:
repeater
preamp in antenna line
higher power unit, as up to 50W is allowed

Or is getting GMRS capability into this situation impractical?

Happy trails,
Gary (net.yogi.bear)

The Yaesu FT-8900R (Quad Band), FT-8100R and FT-8000R will both do crossband repeat.

Also the Icom IC-W32A HT will do cross band repeat.

Put your GPS under the dash and see if it works. If it does, then the glass
is not sheilded.

In this area (Silicon Valley) there are GMRS radios being sold right and left as best I can tell. Fry's had them this weekend for FREE after rebate and I noticed at one of the Fry's stores this morning that they were all sold out even though the sale was supposed to be through tomorrow. They've had various brands over the last 6 months for anywhere from free to $10 or $15 a pair.

Most of the radios only mention the licensing requirement in very small print or in passing in the "manual."

On several of the bargain oriented forums the "great buys" on these radios have been discussed and it's obvious from the comments that not one in 10 has the slightest inclination to bother with a license. Typical comments are "how are they going to catch me." Or, "I'll only use it skiing in the Sierra." Or, "I can do what I want, the FCC has no enforcement and they'll never find me."

It appears to me that the FCC has created another CB band and in a real emergency these frequencies will be clogged with every Tom, Dick and Harry as the expression goes without a concern for anybody else or the requirements for orderly passing of traffic. I think it's only a matter of time before the GMRS repeater owners/users are going to be complaining about this monster that our non-thinking governmental bureaucrats have created to help the manufacturers to make more money.

I'd not waste my time on GMRS or FRS. I think it'll be useless even if you can get a signal to a high antenna without excessive loss.

My personal experience using FRS in shopping centers to communicate with my unlicensed wife is that it too is crowded with people (maybe GMRS people?) with strong signals and the tendency to make things as difficult as possible for you to communicate. I sometimes think they lie in wait, listen for names used and then try to create problems for the use of FRS. Typical 11 meter CB antics.

My 20 cents worth (adjusted for inflation!)

Gary,

You would be surprised at the range you can get from just 2 watts into a gain antenna. If you use good coax, a 100 foot run would only be around 1.5dB (or less) at GMRS frequencies. A good 5/8 wave vertical antenna can give up to 4 dB of gain, perhaps a bit more, and the elevation would more than make up for any coax loss that you do have. Get 3/8" heliax for the run, and you could get up to 20-25 miles line of sight with that 2 watt rig. 50 watts really wouldn't get you much further, especially when the folks on the other end will still only have 2 watts to reach you with.

One thing that works really well for glueing the battery back together is Methelyne Chloride. This also fuses plexiglass. You have to be very careful with the agent; use it outside, because the vapors are harmful. They can cause severe respiratory problems. Also, somebody had told me that it can actually diffuse through your skin and attack some of the fatty tissues in your body, such as your liver. I am not sure how true this is, but it never hurts to be extra safe.

I have a charger conditioner Analyzer III made by W and W associates. It will make your HT and or your cell phone batteries last allot longer than the supplied chargers you get with the bought product. And revive old ones. You can order the type of cup you need for the desired HT or cell phone. The unit cost just under 600 dollars. It is in MINT condition and can provide pictures. W W has ads in QST you cant miss them. You will also get a the following charging cups, Star tac, nokia, ericsson and the old motorola flip phone cup. I would like to trade it for a Mobile HF rig. I am pricing this unit at 400.00 which I think is a very good price. The average cost of a cup is 25 dollars. Below is the link for the manufac. If you want to find a specific cup go to additional cups not the analyzer III there seems to be something screwy with there page.

http://www.ww-manufacturing.com/prod2.asp?pline_id=10

Remove NOSPAM to email me thanks

Bill,
You might do as I, and some others I've seen, have done. Use a
trunk/hatchback antenna mount on the hood. You may even be blessed
with an existing hole (plugged) for the coax.
Howard

Hey all, here is the latest and greatest list:

Prices are firm, do not include shipping, no trades, not breaking sets yet.

Motorola JT1000 handheld, UHF 403-470, FACTORY NEW: $510 (radio, ant, batt)
add rapid charger: $60
add programming key: $70
19 available, per above, lead time is about a week.

Motorola MTX838 VHF 136-174, B7 version, w/FCC ID, FACTORY NEW: $525,
(radio,batt, ant) email for details! (Same as MTS2000?)
24 available per above, lead time is about a week.

Motorola Spectra VHF 99CH, 50w unit, remote w/HHCH, Scan, brkt, spkr.
D43KXA7JA3BK $235, Very good cond.

Motorola GP2000 VHF radio COMPLETE PKG. Keypad or PC programmable
radio/chrgr/program cable, instruction etc.
$240/all, NEW IN BOX, (**THIS IS NOT FCC APPROVED FOR USA, Great for Latin America, Asia?? HAM?? Will ship Internat'l)

Motorola HT1000 VHF radio, spkr/mic, std. chrgr, fair battery.
H01KDC9AA3DN: $270, Exc. cond.

Motorola M120 VHF, 2ch, 40w. 16pin, RADIO ONLY
M43GMC20A2AA: $125, Showroom cond.!!

Motorola Radius VHF, 2ch, 40w, 5pin. RADIO ONLY
D43LRA73A5BK: $75, Good cond., faded, dirty, no cracks/breaks.

(**NOTE: A member wanted the two VHF 2ch. radios. I have not heard back in 2 emails and a week, so I am putting up for sale again.)

Motorola EXPO handhelds, 2ch. on 165.150, includes:
3 radios
3 leather swivel cases, mint cond.
2 swivel belt loops
3 rapid chargers, one has cord cut off w/4" left, other two exc. cond.
2 dead-ish batteries
Radios are in good shape, one missing M sticker on front, all missing Vol. knob rubber and accy cover. They are all assumed working but I will check for sure if interested.
H33XPU3120AN: $75 ALL.

iCOM commercial radios, FACTORY NEW. Low prices! Got a contact wanting a bunch moved out.....

HANDHELDS:
IC-3GT, VHF, 100ch., alpha display, 12.5/25kHz, rapid chgr, full keypad,
etc: $350
IC-4GT, UHF, 100ch, alpha display, 12.5/25kHz, rapid chgr, full keypad, etc:
$360

MOBILES, factory new.
IC-F320, 32ch, 45w, Alpha display, PL/DPL, $350 complete.
IC-F420, same as above, 35w, $360 complete.
IC-F521 VHF, 256ch, 50w, A/N disp., PL/DPL: $360 complete.
IC-F621, UHF, 256ch, 45w, A/N disp., PL / DPL: $380 complete.

LIMITED QUANTITIES OF ALL ABOVE, but at least 20 each radio...

AFTERMARKET iCOM PROGRAMMING HARDWARE/CABLES, $60
Lead time is about a week on iCOM radios...

That's pretty much it, thanks for the reading...

Have a great day!

Randy

I use one, and I bought it at West Marine Supply in Seattle for a bit cheaper than HRO has it. You might check out the local big marine store first. Im using it to mount the head of my IC706MKIIG in my Ranger. Works Perfect and it holds well. Thinking about getting and extension to move it up and out a bit. Here is a couple pix of the install

2071. new NiMh cells in FT-50 Battery FNB41... experiences, anyone??

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-25 17:10:11 UTC
From: Brian Lodahl <lodahl@kom.auc.dk>
Message-ID: <b3g81d$r08$1@sunsite.dk>
Source record: 32903

Hi,

I'm thinking about changing my NiCd cells in the battery for my Yaesu FT-50 Handheld to NiMh type instead. Mainly for 2 reasons:
1) larger capacity and 2) the old ones cannot hold their capacity for longer periods of time anymore.

The battery is of the type FNB-41, 9.6 Volts and 600 mAh. I don't know about the number of cells, their size or voltage, but i bet it is 8x1.2 Volts.....

Does anyone have any experience in opening the battery case for this particular type of battery? I have an idea about the casing being welded (melted?) together rather than glued, and i don't want to break it if i can avoid it or it is a waste of time to try.

Ideas, anyone?

Also, if anyone have any comments on the internal charging circuitry of the FT-50 (if it can charge NiMh or not)... i would be grateful.

One idea:
Put the actual radio (HT?) up on the roof. Then use `simple`
multi-conductor wire cable (is that doubly redundant?) for power,
mic, speaker, PTT and what-ever-else down to the radio room.
Once it's on -- set to frequency -- and had the PL set (if any),
there is little further need to `get at` the rig.

I have one holding my Alinco DR-235T 220 MHz mobile transceiver along
with the control heads from my 796 MKII and F-2020. I have the radios
mounted on a aluminum plate and the ram mount attached to the plate
and truck floor. Seems to work just fine.

Gary,

There are a great deal of motorola radios, 40 watt, 50 watt, etc,
that were used as mobile and fixed stations for fire and police in
the 460 Mhz area that are now easy to get since many localities are
moving to trunked and digital systems on 800 and 900 Mhz.

These rigs are easily programmable for simplex and repeater operations
and a repeater can be relatively inexpensive and as long as you tone
code it out, it may be a great solution.

Around here we have two GMRS machines that have over 20 mile
capacity with just HT input.

Good luck,

this very same rig with the same and even more add ons
sell day in and out for $00 to $550 at best, in mint condition
even with original box and manual, maybe you will find someone
who has not happened upon such a regular deal and wants one
of these low power units really bad,

Good luck

Sorry, meant to say $400-$550, heavy, low power
but if you like an older simple rig, it has some pretty
good features for its day, I enjoyed mine but would
not pay that much for it. The tone board is controlled
by dip switches, manually for each new tone. It is encode
only unless someone came up with a new add on.

I'll have to look into licensing issues on that, but it does seem
promising.

First I would want to test with the $30 2W GMRS base I got for
giggles. If that is successful, we would have more support for buying
a rig as you describe. The antenna could be a homemade, and we can
always use another run of good coax from roof to basement.

For emergency use, I would like to leverage the large number of people
who have FRS and no intention of getting a license. This could
multiply the effectiveness of the hams we do have.

Happy trails,
Gary (net.yogi.bear)

I have an ICOM IC-2KL that seems to have a problem. Its peaking at about 300 watts on all bands now. Started out it was just on 17 & 20! I run it with a 756pro and the AT-500 tuner. Don't know the problem and I don't think I'm technical enough to figure it out.

I was thinking of sending it off to ICOM America service. I wonder how others experiences have been? What is there turnaround time?

Thanks

Hello to all,
I am looking for the front rubber feet for an old NCX-3 or other rig. Also need the four small knobs for the same transceiver. I believe that all these parts were used by National on several of their transceivers. (200, NCX-5 etc.)
Thanks for the responses on my prior quests, and once again thanks for any response to this one.

55 foot Tristao galvanized steel crankup tower in very good condition for sale. Pretty much the same as the current US Towers MA550 tower, parts and accessories are the same. Comes with two standard bases, one is brand new with correct bolt, two new concrete anchor bolts, new eve or house bracket, new set of three coax arms (about $200 in new parts that you will need anyway), and a rotor plate. It is on the ground ready to go. Located in Seattle. Easily transported with a rented 18 foot boat trailer for about $40-50 a day. $800 firm, you remove/transport. Instant big gun stuff!! Mike K7MH Seattle, Wa. 206-356-3769 or Hurricane145@worldnet.att.net

Hi Steve,
Is the 300W into a known, good 50 Ohm termination? What does the input VSWR of the amp look like?

I thought I sent this reply already, but it hasn't shown up, so here goes again:

I sent my IC-706MkIIG back to Icom for warranty repair. I think it took about 4 weeks from NY to WA to NY (UPS Ground both ways); IOW, they had the rig for approx. 2 weeks. Whether free warranty service is faster or slower than (or just as fast as) paid service I have no idea.

There is a form on the Icom Web site you can print and fill out to send with the rig.

Hi !
I do have a Alpha 89 linar amp. that have gone QRT.
Is there anyone with any experience of repairing these ?
I would like to get in contact with someone that have this amp. and do know it inside out ! I will explain the problem as soon as anyone takes the time to answear me :-).
I know this is a great amp. and I guess there isn't many that have had problems with it.
So please, if anyone have any experience, take contact.

Well guys thanks for the info. I have struggled for many moons finding
diabolical methods for opening these battery cases., I put one in the
freezer last night and whacked it this morning and hey presto!!!!
Sometimes the least elegant methods are the best! Cheers guys.
Renfred.

Source record: 32944

Hi and thanks for the reply.
The problem is:
After I have turned the amp. on and waited for 3 min. so the WAIT light turns of, I switch the amp to OPR.
Then I can hear that my transceiver gets quiet. I can hear that there is a great signal loss. I even have high SWR if I try to trigg the transceiever.
Switching the amp back to STBY, and I have the signal back.
I have tried to replace some components in the amp.
Have replaced the transmitt PIN-diodes and the receive PIN-diodes. No change.
Have checked some fuses. Replaced a transistor Q2 on the controll board who triggs and relay named K1 (TQ2E). No result.
Perhaps it could be the relay K1 ?? I can hear relay K2 on the T/R board activate when I switch between OPR/STBY so I think that one is OK?!
I hope you have some tips for me here !! :-)
Would be glad to hear what you think.

Agilent (formely HP) makes good spectrum analyzers and sig gens.
I have never particularly liked Tektronix for spectrum analyzers,
but prefer them over Agilent for 'scopes.

However, I would HIGHLY recommend that you also look
at Rhode & Schwartz for both spectrum analyzers and sig gens.
They have some EXCELLENT products in those areas.

If you're looking for high performance 'scopes, in addition to
Tektronics, I'd take a serious look at LeCroy ...

NOTE: I have USED equipment in these categories from
all of the above-mentioned sources, but have NO stock,
employment, or other financial interest in any of them ... I'm
just offering my opinion based on use, features, etc.

Excellent condition DX70T 160-6m mobile (10W on 6m) complete with hand mic, Astatic D104M6B mobile amplified mic, power cord, manual and original box. I do not have the mounting bracket. Comes with EDS4 separation kit and home made mic extension cable. Other extras available to interested parties. I purchased this radio less than 3 weeks ago but I have decided not to pursue mobile HF at this time.

$800 CDN (I pay shipping in Canada) or $550 US plus shipping.

reply direct ve3tmt@yahoo.ca

Thanks,
Max

2123. Garmin Rhino 120

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-27 21:32:58 UTC
From: N9NWO@amsat.org
Message-ID: <d1b0ff4b.0302271332.3c460ea1@posting.google.com>
Source record: 32855
Cross-posted to: sci.geo.satellite-nav,rec.radio.amateur.equipment,misc.survivalism

I just purchased the Rhino 120 unit. It is
a GPS unit (9Mb of memory) with maps that is
connected to a Family Service Radio (FRS).
The FCC is allowing these radios on the market
so that GPS coordinates can be relayed, automatically,
via FRS.

I found the unit to be very good. Especially for
$249 (very lucky to find any GPS units at Ft Bragg
as the Army units are making large purchases to take
with them). I visited a friend in Arlington VA a
few days later, who also has a Rhino 120. We played
with them just to see how well they would transmit our
positions. It would instantly update every time we
transmitted, showing our location on the map plus the
distance between us.

I also used the unit as a strip map on my way home. It
constantly tracked my location, even expanding the map
when I was near a major city. I put in points were I
wanted to make turns onto various interstate highways,
it located the exits and displayed them!

The only problem is that the screen is small. And my
friend found that the controls are bit overwhelming to
those who are not very technical. But then Garmin is
going to come out with the iQue 3600 this summer. It
is a Palm Pilot (OS 5) with 36Mb of memory and a MPeg
player (it can be used to tell you turn right or left).
Bigger screen, drop in memory (Palm style) with everything
in one package.

Now if we could only get ICOM or Yaesu to link up with
Garmin to have this in amateur radio handhelds. It would
sure beat ARCARS (or whatever it is called). After all
this system works while the radio is transmitting voice!

N9NWO sends......

I recently lost the dimmable backlight on my Range 5054-Dx LCD. The display is readable in a well lit room but would not be in the dark.All other features on the rig are working. I made one attempt to try and find out what went wrong but with very poor prints downloaded off the FCC ID pages.

Has anyone had this problem and if so what did you do to fix it? Rig is out off warranty.

Thanks
Dave

It's a simple LED on either side of the display. If you've got soldering skills (I certianly don't!), then it shouldn't be too hard to replace. Try calling RCI and see if they can help you.

I'm now imagining people all over the country whacking frozen battery packs of all types on anything hard (sidewalks, cars, etc), with family, friends, and neighbors, looking on in total bewilderment. This high tech stuff is truly amazing - stores well in the freezer right next to the wife's leftover meatloaf and opens easily in its frozen state. What will they think of next? ;)

Maybe they'll think of where I can buy 2/3 "AA" batteries for these packs,
now that I have them open, for less than I just bought entire packs from
sunnbattery.com... paid $64 for two 1000mA Lithium Ion packs... the regular
600mA NiCd packs are only $28! I can't buy the batteries to recell the ones
I've got any cheaper. :|

Is anyone aware of a source for a compact 12v DC, 500mA, AC adapter that can be used both here and overseas? A compact, lightweight, adapter is preferred. Radio Shack has some nice "travel" adapters, but none above 9v. I've searched the internet, but haven't had much success. The only ones I found were too large and too heavy.

Your assistance is appreciated.

2139. Leaving HT in Yaesu CD-15A Charger?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-02-28 05:12:18 UTC
From: Dwight Stewart <stewart@say.net>
Message-ID: <BA8459E1.11970%stewart@say.net>
Source record: 32871
Cross-posted to: rec.radio.amateur.equipment,alt.ham-radio.vhf-uhf

Does anyone know if it is okay to leave a radio (Yaesu VX-7R) in the Yaesu CD-15A rapid charger for extended periods after the radio is charged?

The manual doesn't offer a hint either way. It does say the radio can receive while in the charger (and warns against transmitting), but gives no details beyond that.

At home, I'd like to leave the radio in the charger all the time, except when I'm actually using it to transmit. And, once I'm finished transmitting, place it back in the charger. Does anyone see any problem with this?

Check out a computer store. There are tons of "autovolt" adaptors for
12~15VDC made for things like printers and laptop computers. Good regulation
switchers with about 3 amps of current... and most are small.

Why would you want to leave it in the charger once it was charged?

I would think the heat/pressure build-up would reduce the life span of
the cells.

a power surge might have burnt out one of the bulbs.... it uses 2 6 volt bulbs and they are strung in series.... you can use an ohm meter to see which one is bad.... radio shack or any parts house should have one for you.... try a CB Shop if you have one in your area....

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Greetings:

HERE IS THE PROBLEM -- In the past, I have tried to help some with technical questions relating to ham gear. Too often, I have taken the time research the question and write a response, some rather involved, and send my response back, only to have it rejected because of a non-working email address.

HERE IS THE SOLUTION -- If you would like a response from someone who wants to help, PLEASE make sure that your return EMAIL ADDRESS works and is not one that will fail because it is has some error, is incomplete, is obsolete or has some other problem. Additionally, please DO NOT put "NO SPAM" or any other killer-filler inside your email address!

HERE IS THE PAYOFF -- You will get more help with your question(s).

Cheers...

Al

Bill:

Looking at your return email address, jamspam@upyours.now, I can see the basis for your response.

I disagree with your SOLUTION. Most responses are directed to an individual's question or concern. Additionally, I don't think the group would be interested in answers to some of the mundane questions that get asked. It would be a waste of their time and a waste of server space.

Cheers,

AL

Replying via email is something I try to avoid. If you send the reply
to the group the added advantage is that in case someone else has the
same or similar question he/she will be able to do a search on
groups.google.com and find hilp without asking the same question
again. Time saved for the poster, time save for people answering the
same question over and over and serverspace saved (except on google
:-)))

Listen up, everybody! This is a News *Group* (a Discussion *Group*).
(Actually, since the OP cross-posted: *Groups*)
No one here is communicating privately. You ask here -- you get
replies here. If you don't want the replies to your questions
to be `out in the open`, don't post -- save our bandwidth. If
you are replying and are nervous about anyone except the OP
seeing your reply, kill the urge and move on.

There are a few folks that refuse to `buy in` to this concept.
But, then, there are those that refuse to quit Top-Posting, too.

I'm afraid you're missing the point of a news group, Al.

The idea is to promulgate information to people who need it. Many
people read the postings, both questions and answers, and benefit from
the information without ever participating in a particular thread.

By replying using email, you deprive these individuals of the benefit
of your expertise. You also shield your comments from peer review.
Perhaps that's your intent.

I chuckle everytime I see someone trying to create the internet in their own image... the way they think things should be......

Top post or Bottom post
FA or just any good subject line
Include valid email address or not
Use real name in post or not
HTML or no HTML

The magic of it is.... they are all correct! One decides how he wants to post and what he wants to read. He does NOT decide how someone else posts... he has no say or control of that. Take a good look at the newsgroups today. Enjoy. In twenty years it will be totally different with things you have not even imagined.

Steve

One of the big 'phone plugs' The rj-45 is the correct name and if you want to you can cut the end off of a computer network cable with a few inches of wire and use it.

There are *many* benefits to posting answers to the newsgroup.

First, it is archived. It might well be a mundane question that
is only asked once a year... but if you have a really good
answer, it will be available for those researching that or
similar questions through the google archives.

Second, your answer may trigger someone else's memory, and
they might be able to provide even more information.

Third, what if you are simply wrong. As in this case... :-)

In all of the above, others will post, and many will benefit.
That's what it's all about.

I have been emailed by four individuals who have been contacted by the thief in Santa Barbara, CA trying to steal their radios. Again the info is:
1120 Laguna ST
#14
Santa Barbara, CA 93101

Phone 805-451-3042

This person has used the names Gabe Mariscal, Jeff Graham, and Jeff Kydd. At least two persons have been ripped off by this guy in trades. I would be leary of anyone in this area. He has used email addresses mojo-radio@cox.net, and gabe1972@cox.net . He has offered for trade a RS Pro 2006, Icom R75, RS Pro 43, and other equipment.

My Icom W2A will not power up. There was no event to cause this. Has anyone ran into this? I thought that maybe the internal backup battery may have become discharged so I left the radio plugged into the charger all weekend. Still no power up. I tried holding down the function key then sliding on the battery before powering up the radio. Icom says this is how you restart the cpu. But I'm sitting here with a dead W2A.

Thoughts?

>

Per pages 36-37 of the Kenwood TM-G707A manual, those are the Programmable Memory channels. There are four of them and they are used to basically store all custom parameters a user sets up in the radio. Thus, if your spouse was using the radio with her preferred settings stored in PM channel 2, she could select PM 2 and implement all her settings at once. When you get the radio back, you could implement PM 1 and get all your settings back.

Here's the solution. Respond to the questions in the newsgroups.
That way EVERYONE gets to see the answers!

BTW, I don't use a "spam-proof" e-mail address, but sure can
understand why many folks do. I also prefer to see my answers in the
newsgroups. I figure if my question is good enough for me to ask, the
answer should be something that others may be interested in...

Actually, the discussion is not about newsgroup postings, Stephen. It is about people responding to newsgroup postings by email. And, given that, I have to agree with the others here - newsgroup discussions should be kept in the newsgroups. An email response is too personal, when a personal response was neither expected or invited.

Also radio shack sells a snap together plug that requires no special
tools to use. I used one on my desk mike. It's about 6-7 bucks, but
cheaper than buying the tool and a bag of plugs...Or at least if you
only need one of them. MK

If the question can be answered in a short form it should be to the group. I have seen a request for a schematic and most news groups will not let you send them via the group. I have sent small ones Z(say ones that are less than a meg or so big) directly to the people. If it gets bounced because of a faulty address then I do not try to send them again usually. I just don;t feel like taking the time to take the extra 2 seconds to look at the heading to see what I need to do to send it direct.

2179. F/A: Complete and functional Victoreen 3-unit Radiation Detection Set

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-01 15:00:00 UTC
From: Mark@The.Toob
Message-ID: <7mi16v4sg36pp2rdgld2f414opu7f1db41@4ax.com>
Source record: 32811

A complete Victoreen Radiation Detection Set in the Civil Defense carton. The set includes the two-high range units, the low-range unit, headphone, dosimeter charger, 6 pen dosimeters, carry straps, and operating manuals. The low range unit (M700) is useful for checking for radium paint on older military radio gear meters and panels, and also for geology buffs. The high range-units are true war meters suitable for use after a nuclear attack or Chernobyl scenario.

All units are operational, and guaranteed to function. The three detectors calibrate/zero correctly, and the dosimeter charger correctly charges the pen dosimeters.

If you can keep the TR relay pulled in between the characters you can use it just fine. CW and FM can be amplified with a class C amp that you probably have. It will not amplify AM or SSB. Well, i guess that it might amplify those modes but it sure will sound terable and probably splatter all over the band hihi..

2181. 2M CW into a 2M FM amp?

I think what people miss sometimes is that very few people come to
the newsgroups to be helpful. They come because there is something
of interest going on in them. Reading people's questions in
themselves isn't all that interesting. If the answers didn't land
in the newsgroup, there'd be very little to read, which would result
in the people who can answer the questions to stop reading the newsgroup,

I come to read what other people are saying, and adding when appropriate.
Because of that, I'm here and ready to answer a question if I can.

Most amps made especially for FM do not have any (almost none) delay built in. There is no need for it. I operate a large ammount of ssb so all the amps I use are hard wired to key with the transmitter. I can't talk fast enough to keep the relays keyed..hihi. I thought this would be the case for the amp you are using if you wanted to try CW.

"I" prefer direct replies, as there are times when the newsgroups are down with my ISP, and I can only get E-Mail. Therefore, if I've posted a query, I don't want to have to wait for the newsgroups to come back to life. When I reply to people asking questions, sometimes, if it seems a personal sort of dilemma, I may try to answer them directly. I hate it when I get bounced. Needless to say, I don't answer many... For an example, if someone is looking for an item, I may reply that I have one, condition, price and terms. I feel they are looking for it, therefore, that e-mail is meant directly for them. Why bother the rest of the group with a useless (to them)posting? Besides, the terms I'm offering them isn't everyone else's business.
Just my 2 cents or preference on this issue. Although I will say, I can understand the other side of the coin.
But, as they say, to each his/her own.
--

> problem?

My audio works fine. The problem with APRS is that
we have to have a dedicated radio whereas the RINO
system (and Motorola and Audiovox also have systems
on the market) transmits a packet as part of the transmission.
I expect that in time this system will replace APRS
(radio location via packet radio).

GPS-Intergrated FRS/GMRS radio
(RINO - radio integrated navigation outdoors)
http://www.garmin.com/products/rino120/

http://www.garmin.com/products/iQue3600/
This also is a very interesting product.
Palm Pilot with Garmin GPS built in. Should
be out by June.

I expect that will will be seeing more and
more ham and commercial radios with GPS as
a part of the system.

A lot of the Mirage amps have a SSB/FM switch on the front panel. GOing
to the SSB mode changes to a longer hold in time on the relay; in fact,
that's all it does.
John

I'd not say an e-mail response is excessively personal.
Different people interpert this differently.

I have a distinct dislike for fake return addresses as there are times
I do want to reply directly to the poster when I think it appropriate.

The biggest problem is that those using the fake addresses to try and
avoid their address being harvested, keep forgetting to change it to a
valid one when they send e-mail.

>in the people who can answer the questions to stop reading the newsgroup,

I would much rather have answers to my posts CCd to me as that way
they end up being posted and I still see them. I mark threads, but it
seems that more and more postings do not link to the thread. I also
follow a lot of news groups. There are many times I never see my own

post show up, but see answers...Nor can I find the original by using
<show all posts>

The end result being I probably miss 15 to 25% of answers to my posts,
or posts in the threads in which I'm interested.

I do not treat a CCd, or answer to a post as private,

Yes, as Max has already correctly answered, there are two sites and they are different.

By the way, in the UK a very interesting site is www.ciruitsarchive.co.uk The OM there has a good collection of Heathkit schematics free for the downloading. NOTE: he is temporarily down as a protest against Bush's plan for a "greater good", but a temporary page says he'll be back.

Hi, inherited a box of electronic stuff and have an attenuator that has a 10 position rotary switch and knob.Switch has 3 teirs and all the contacts are gold with high precision resistors soldered between the teir contacts. The unit is completely enclosed using brass screws for of heavy gauge aluminum casr. On the top of the case are two connectors (look like small BNC type) marked J! and J2. The case is all grey and the only markings on it are "13A ATTENUATOR". Case measures 2 3/8" x 3" x 2 1/2" tall exccluding the switch and the connectoer terminals. Trying to find out who made it and what it was used for??
Thanks, Don WA1TVH email dpelrine@c4.net or answer in news.

Well, mine stay put where I left them. If you leave 12VDC on the radio all the time like I do, then it will retain its last channel memory. My base is on a battery. I never disconnect it, I just turn off the radio. Same in my two mobiles. Thus, when I turn the radios on, they are always on the channel I left them on.

Actually, I prefer just the opposite. I hate unsolicited or unexpected large files via email. I often check my email quickly when I'm rushing around, and a large download is a irritating delay. Because of that, I set my mail program to automatically reject all large files except those from the people in my address book. Large files can still be sent, but only if I know about it a day or two in advance (so I have time to add the sender's address prior to the file arriving).

Instead, I would rather receive the large file at my convenience - posted to a binaries newsgroup or a web site. For example, I keep a web page on my site just for others to download a large file. When I want a person to have a certain file, I send them a link to that page. After that, they can visit the page and download the file whenever they want. Works great.

And you can get that direct reply by simply requesting an email response in your postings. Regardless, that doesn't change the fundamental nature of newsgroups - newsgroup discussions are for the newsgroups, not email.

If you have the manual, the table on page 25 shows all of the menu
items and their default values.

Without the manual, to see the default values, turn the power on while
holding the CLR key. The menus will show the defualt values, but will
revert to the previous settings when you turn off the power.

While a reply directly to a person may be appropriate posting a proper
email address to a newsgroup is bad news. After posting to newsgroups about
2 years ago I am still getting several messages every day about how to keep
from being obese and how to make my male member longer. It appears that the
only way to get rid of this spam once you have posted to a newsgroup is to
get a new email address!

2228. HT - 2mt & 440 which to buy

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-02 15:16:47 UTC
From: ron@texw.com
Message-ID: <c9361952.0303020716.63438ced@posting.google.com>
Source record: 32760

I am looking for opinions of which HT to buy. I have been off VHF for a while and lost touch with all the features the new FM HT's have. Can someone give me some pros and cons. I prefer any of the big three ICOM, Kenwood or Yaesu. I would like the dual band receive (if possible) such as the ICOM w32a. But I think the new very small Kenwood also does 220 and has HF SSB receive. What do you all think? Is the w32a out dated? I don't have any HT at present.

Thanks, Ron
W5AKA

2229. FS G.E. MASTR II MANUAL

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-02 16:08:27 UTC

I have for sale 1 G.E. Masrt II Maintenance Manual
which covers 406-420 & 450-512 Mhz 40 Watt Mobile.
LBI-4620A.
This manual contains the following inserts:
LBI-4620
LBI-4622
LBI-4627
LBI-4613B
LBI-4628A
The manual is in fair condition meaning the cover of
the manual shows wear. But the pages in the manual
are in excellent condition. They are not ripped or torn.
I asking $25 dollars plus shipping. CONUS ONLY
If you have any questions , please email me
Thanks

It looks as if you might not be in the United Sates. Here is where you can
find some frequencies to listen to. Most are below 30 mhz. For a scanner
on fm look around 144 to 146 mhz if in England.

http://www.arrl.org/FandES/field/regulations/bands.pdf

2242. DX4WIN - CW driver cannot open

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-02 19:52:24 UTC
From: Thierry <lombryt@htomail.com>
Message-ID: <3e6260f9$1_2@news.vo.lu>
Source record: 32773

Hi,

Using DX4win 5.03, a licensed version, me and 2 others OM experiment a strange problem.
In the past one of us can use the CW keyer (in File, Preference, radio, CW Keyer) on LPT1 to send automatically answer to QSO in CW (maionly used for contests).
Now he can no more. Me and another friend have never used such option, but after the problem he had we tried to configure it, using LPT1,... unsuccessfully too.

In fact when we save the configuation, DX4WIN display an error "Could not open CW driver".
With all my knowledge of IT administrator, I cannot solve thios problem.
In other hamlog software the LPT1 port is well active. So I have the confirmation the problem is not link to the OS (both ME and XP experiment the same problem) but this is really a setting in DX4WIN.

Currently we are always waiting answer to our mails send to Paul KK4HD.

Some hints to activate this LPT1 in DX4WIN and avoid this error ?

Thanks
Thierry

Don't know what bands your scanner has, but you might check with a
local ham radio club as to which frequencies are active in your area.
Also, in the US, there are scanner guides published with various
frequencies of interest.

>Appreciate the info. Any idea how many db per step on the switch? Think I
>can assume it is 600ohms in and 600ohms out?

I don't remember a "13A Attenuator" specifically, and a quick
web search didn't turn up anything. There are a few things you
can assume though... for example if there is just one switch it
is probably 1 dB per position, but could be 2 dB too.

You can determine the impedance easily with an Ohm meter! Put
the meter across either the input or the output, and move the
switch from one end to the other. The position which results in
the lowest resistance is the highest attenuation. And if the
attenuator has 20 dB of loss the resistance would be almost
exactly the impedance. With 10 dB of loss it will be pretty
close, and if its only 3 dB it will be significantly off.

Hence if it reads 602 Ohms, you've probably got 20 dB of
attenuation and a 600 Ohm impedance. If it reads 630 Ohms (a
wild guess, I didn't calculate the answer) that would be more
like a 10 dB pad, and a 3 dB pad might show something closer to
1000 Ohms or higher.

If it is a 75 Ohm pad (which I suspect it is due to the
description you gave for the connectors), the values will be the
same percentage of 75 Ohms instead of 600 Ohms.

There are three possibilities for impedance, 75, 135, and 600
Ohms. If the connectors are coax, it is probably 75 Ohms. I
don't recognise the connectors from your description though.

Note also that when WECO said a pad was 1 dB, they didn't mean
something close... they meant 1.0 dB, exactly. What you have is
a precision attenuator.

I have the Alpha 86 that has had the same problem. Its a very simple to fix, the problem is just a blown fuse that is inline with the RX signal. My manual had the instructions to replace the fuse so you may want to double check your manual. Email me directly and I will check my manual for the specific fuse.

2260. Trio/Kenwood RF Signal Generator - Need specifications

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-03 09:38:37 UTC
From: simmi <simmiv@ozemail.com.au>
Message-ID: <3e632299$0$11663$afc38c87@news.optusnet.com.au>
Source record: 32792

I've aquired a TRIO SG-402 RF SIGNAL GENERATOR. It has a range from
100khz - 30Mhz. It works fine, but I don't have any manuals or information
on it's accuracy or information in general. It has a modulation swithch
with three options EXT (For external modulation) CW, which I don't know what
means and INT for internal. I was just wondering if anyone has some
information on this piece of equipment.

Mike;

Check www.eham.net/reviews, then HF Amplifiers & scroll down. You will
see owner comments on nearly every Amp Supply model made.
New sell price was $1595. factory direct (No dealer network) for the
LK-500NT-B model in 1986.
The optional floor model power supply, PAC-5 was $449. (Yes, I'm a
packrat, keeping ham gear brochures in my desk and file cabinet for
past 31 years!)

Good luck,
Jim, K4SQR

Those are NECCESSARY! If you have your real email address, it is an open invitation to spam! By adding a little extra to your email address, it helps defeat automatic email address finder programs. All you have to do is edit out the "spam" thing at the end of the email address. It only takes a moment for you to check the email address and modify it before you hit that send button. You'd think after all that "research" you did to find an answer to someone's question, you'd at least take the time to ensure there's a proper email address in there. If you can't find one, reply to the group!

2273. Programming the TM-G707a

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-03 18:10:27 UTC
From: marcus_harton@hotmail.com
Message-ID: <7bc24e8d.0303031010.79b51f2@posting.google.com>
Source record: 32705

I bought the TM-G707a and the programming cable to connect it to a PC to load frequencies.

I got the software installed and filled in the freqs I wanted to use, but I'm getting a recurring error - "invalid com port" - from my pc whenever I ask it to read or write.

I have corresponded with Kenwood customer service, and they sent a list of com port settings (which match my computer's settings,) and suggested that I contact my computer manufacturer to find out why I'm getting the error.

I loaded the software on another computer and get the same "invalid com port" problem when I try to write.

Both of these computers do fine using the com port to hot-synch my palm pilot, so I suspect the problem may be pilot error on my part. But I can't find any step-by-step instructions for reading/writing freqs with a pc. Kenwood says it has no documentation beyond what's in the "read-me" file and in the software help section.

Neither one has gotten me working. Anyone else have this problem? How did you work through it?

Thanks,
Marcus nz4e

2274. New Homebrew Website Up and Running

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-03 18:24:49 UTC
From: Pete KE9OA <n.gianakopoulos@worldnet.att.net>
Message-ID: <R5N8a.8924$Uy4.769613@bgtnsc05-news.ops.worldnet.att.net>
Source record: 32706

Hi Folks,
I've got my website up and running. Some of you are
familiar with me, as a receiver designer, and have asked me to do this for a
long time. I've got all of the design information, including full size PDF
board layouts, schematics, DDS code, theory of operation, and parts
placement diagrams embedded in a downloadable zip file
The nice thing about the PDFs is that you can print
them out either on Inkjet or Laserjet transparencies, giving you a good tool
to use with photosensitized boards. I've also put up a few other things,
such as a high output RF noise source, a white noise source for audio use, a
general purpose SSB detector for use with boatanchor receivers, and a LW/MW
bandswitched active loopstick antenna. The url is:
http://home.att.net/~n.gianakopoulos/wsb/html/view.cgi-home.html-.html
You do need Acrobat Reader, Version 5.0, in order to view and print out the
PDF files. This is available as a free download
from the Adobe site.

Thanks for reading this post!

Pete

Be sure that you have shut down or disabled the software for the
Palm when you want to use that com port for other software. If
you have the hotsync software loaded it will open/own the com
port and other software cannot use it.

Ran into this myself.

I ordered one at Radio Shack. They don't show it in the catalog, but I went to the store. Several of the ham radios on display used the connector, so they just ordered a replacement cable for one of their models. I had it by mail in under a week.

Not quite correct. The address uce@ftc.gov is NOT for reporting spam. It is for reporting internet fraud. Examples would be the Nigerian scam, the Chain Letter scam, etc etc.

I hear this argument regularly, yet I've been posting with this
address since 1996. I frequent close to 30 newsgroups although not on
a regular basis. My e-mail address is posted at the top of my home
page as is my telephone (which only gets an answering machine)

Yes, I get some spam, but nothing compared to what I hear a lot of
people complaining about.
I set my filters and in the last two months have trapped 199 messages
and I've probably deleted about the same as of 2:07 local time today.
two months = 60 days = 400 messages = less than 7 per day "on average"

as they come in spurts. I get that much junk snail mail.

Having tracked the timing and addresses(yes I do have other addresses) I find that the vast majority of "my spam" does not come from addresses harvested from newsgroups. Instead it comes from where I go when surfing, and primarily from answering the "surveys" from national news organizations.

On occasion I find that visiting sites listed in newsgroups results in them trying to place code on my machine(s), or they know who has been there.

I can refer to some files on my ISPs servers and tell you who has visited each of my pages and how many times over a specified period. (part of being a dot com). Their default return addresses AND the IP. I rarely look at the files as I'm not interested in who visits and although I have a dot com, I'm not really commercial. So, it's not just the newsgroups that give up addresses.

The older browsers are particularly bad as they gave out a *lot* of information. (Pretty much everything that was in their configuration), but a lot still depends on your configuration, internet connection, your ISPs server configurations, "default reply to address", and whether your computer is online all the time, or if it has a dynamic address.

New ones are not bad, but go visit one of the security testing sites to find out how much information you give out when surfing, or how vulnerable your system is to outside sources.

Each of my machines sits behind its own firewall and they all sit behind more isolation AND a dynamic IP. Yet I've set here and watched someone probe every port on the machine and then start over when they didn't get through the first time. I've now forgotten how many hundreds of probes there were in that series, but it was a bunch.

As an added note, contrary to what many users think, people you know are the most likely sources for viruses sent as attachments.

Practice safe computing.

> HERE IS THE PAYOFF -- You will get more help with your question(s).

And if you are naive enough to put your real email address in you post
to a world-wide read newsgroup you get another payoff, too.

Years ago when I was new to newsgroups, which, unlike email lists, are
publicly posted all over the world, I used to post with my real
address. The payoff? That address now receives approximately 40 to 50
spam messages on average per day!!!! It is no longer usable, except of course
as a SPAM TRAP.

If you wish to reply privately to a publicly posted message, just
remove the NOSPAM stuff. It really is that simple.

One of the nice things about newsgroups is that answers are posted for
all to see. As many have pointed out, most readers browse the groups but
rarely post. And although there are technically no "rules", there is
tradition, and tradition within newsgroups is that you follow up to the
group, not the individual, unlike email lists, where you typically
follow up to both the list and the poster.

Kinda like English Common Law ;-) It may not be a "rule" but breaking
"tradition" often has unpleasant consequences.

I have the following radio cabinets for sale in SE Pa..
1-Motorola Compa-station cabinet with 15 amp power supply, Maxtrac/Radius mounting bracket and Maxtrac power cable. Perfect for remote operations or repeaters.

1-GE cabinet from the old Master series base stations, this cabinet is completely empty.

I'll take $125 for both cabinets, will need to make arrangements for pickup. If you have something for trade let me know.

please email direct if interested

Source record: 32722

Actually, there isn't any mechanical info on that loopstick; I used an off the shelf loopstick that I picked up at a hamfest. I did measure several of the ones I've picked up over the years, and they seem to measure between 230 and 280uH, so that is a good range to shoot for, if you wind your own. Litz wire is a good wire to use, when winding these things. The coupling coil doesn't need to be more than 15 or 20 turns, wound next to the tank coil. Type 61 material is good for the LW/MW range. With the values shown on the schematic, the tuning range is from 155kHz to 2040kHz.

A more interesting question is: will anyone _care_ what the protocol

they are waterproof FRS radios. Very expensive waterproof radios.
The GPS is a gimmick; data over a "500mW of UHF between rubber duck
antennae" link is a waste of a good idea. It is almost hilarious that
Garmin had to pay off^H^H^Hlobby who knows how many people to get
their FCC clearance for this nonsense ...

Well, they're also GMRS radios with 1 watt output, plus the 120 is a
mapping, WAAS capable GPS with downloadable map support. The GPS
capabilities are better than "gimmick" IMHO.

"VHFRadioBuff" wrote:

> Those are NECCESSARY! If you have your real email
> address, it is an open invitation to spam!

I disagree. I use my real email address and have found it depends heavily on the newsgroups you post to. For example, I never get spam after posting to the radio newsgroups. However, posting to a Microsoft newsgroup causes a flood of spam. In fact, posting to any computer related newsgroup results in spam. The same with the adult newsgroups.

I was able to prove this during a recent move as my email address changed four times in a short period (about three months). I continued to post to the radio newsgroups during that period, but saw no spam until after I posted a question in a Microsoft newsgroup. Shortly after that, following another email address switch, I saw no spam until I posted to a newsgroup dedicated to the Macintosh.

At this address, I get one to two spam messages a week. And I suspect those come from a post to a Macintosh newsgroup using this address about three weeks ago (that's when they started).

My feelings as well. For $249, it was a
very affordable GPS unit that had FRS/GMRS
thrown in as well.

What will be interesting is to see how this
technology migrates to other services.

I believe that WinXP at least, not sure about ME, cannot "do hardware control via ports". Win 98 is OK with this. I am not sure of the particulars but when I purchased a cable for using CW with Logic6 and a Icom746, the package noted that this was the case and the cable will not work with XP, I don't recall if it mentioned ME or 2000 or not. Then you've been lucky. For some reason, spammers believe that since these
newsgroups have the word "Amateur" in them, they have something to do with sex.

If you look at the price of the eTrex Legend the features of the GPS are identical to the Rino 120. The list price is $267 and regular price is $249.00 on the eTrex Legend. Plus you get a 2 way radio with peer to peer positioning. You can see how far another person is away from your present positions. So there are many uses for this unit even road navigation with the optional road maps from MapSource. Is there room for improvement? Sure but this is something that no other company has done and with all new items there is some scepticism on the viability of the product.

Well, Ed, I consider myself an experienced newsgroup user. I've posted literally hundreds of messages, some dating back to as early as 1993 or perhaps early 1994 (all using my real name and real email address at the time). And I never said any newsgroup is safe from spam bots. I simply said "I" never get spam after posting to the radio newsgroups. That is personal experience, not a blanket statement about spam bots.

No no. DX4WIN works fine in most environments, including NT, ME and XP and
on these OS the ports are well active.
I received the driver. It is called vichw11.sys (not "ll" but "eleven") and
is compatible ME and XP. It must be copied in \windows\system32\drivers.
From that moment the CW driver works fine.

NEW UNIVERSAL RADIO EQUIPMENT GRADING
STANDARDS (UREGS) READY FOR REVIEW

Greetings All:

A few weeks ago, a group of hams combined their efforts and created what, hopefully, will become a useful set of criteria for judging the condition of ANY radio equipment and assigning a condition GRADE, for use by traders.

We researched existing grading standards from the Collins owners group as well as the Drake owners group and made needed modifications and additions to make the grading standards UNIVERSAL and applicable to any manufacturer or style of equipment.

The final DRAFT of our efforts are provided for your perusal at the following URL:

http://www.parismtnsignco.com/UREGS.htm

Please feel free to respond with any suggestions, questions, and other feedback you might have.

Thank You!

The UREGS Committee

AL and guys....thanks!! very much
Looks like a good deal AL....However you present it as "law" and say
"will have" instead of "should have"....I will be glad to use it, but
its still one mans opinion when it gets past new, dont you think? And
its still just a suggestion or a tool, a classification that we may use
if we choose to use the "standard" And I like it but you need a few
Texas in on it, so we will know what size boots to wear..hihi...73
Murray #8. No way...its just "without manual" equipment can still be
as new, yes?//// Average? but needs repair...? pretty liberal are you
guys democrats? hihi... I dunno its close, but may bear some updating..
Not perfect but getting there!!! We can use it!!!

Well, I hope you all had a lot of fun building up these designations.
Because that is going to be all you are going to get from your effort.

They are too complicated. They are written in a language level far
above the elementary school level understood by most people. There
are too many conditions required for each level.

Keep trying. When you can condense the information into one sparse
easily remembered sentence per level you will have achieved your goal.

73,

Chuck, WA3UQV

Hi everyone
I'm trying to find spare mixer diodes , 1N416D or E, or 1N21E, cartridge mount (I think that's what the ceramic barrel is called)
I've seen them for about 8$ each, is this a good price?
And does it test like a rectifier with an ohm meter/diode tester?

Much too complicated and no radio meets EACH criteria under each category. Most hams will not take the time to use this many items to grade their radio and will still use his "judgement". That is where the problem has always existed. Good attempt, however. A cabinet scratch on a new radio while taking out of box should not lower the unit down to a good condition. A new cabinet would be cheaper than to lower the grade to a good in most cases. I do not see but a few trying to use this system as it now stands, just too in depth. Thanks for stimulating us on the matter. I helped devise the CCA Collins grading scale years ago and even that was difficult and pertained to Collins specifically. 73 San K5YY

2337. ICOM 475H weird problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-06 02:46:20 UTC
From: af8c@arrl.net
Message-ID: <v6ddjso0cv2pa3@corp.supernews.com>
Source record: 32669

Hello,
Anyone have any advice or experience with the ICOM 475H in a similar way as we have here?

Rig tunes 430 to 450 MHz, problem occurs all the way from 430 to 450 as follows.

It's as if there are these subbands on the VFO, 512 kHz long, in which a percentage less than 100% but not exactly 50% of the subband causes the audio to mute, but in the other part of the subband the audio is not muted.

Audio mutes (as if squelched) in a repeatable cycle up and down the band, in whole cycles 512 Khz long. Since 2^9=512, it could be a synthesizer problem? As I said, the muted section of the 512 Khz is not exactly 50% of the band section. It can vary in percentage, but the 512 kHz is still true to repeat the cycle. In testing modes, AM, FM, USB, LSB, and CW, there is a 3 Khz offset from USB to LSB (as if related to the IF/BFO design offset) in where the muted section of the 512 kHz "subband" sits. But the muted section is not the same percentage of 512 kHz on AM as it is on FM, etc. If the muted section was exactly 50% of the subband, I would begin to suspect a problem with one bit in a counter in the synthesizer.

Anyone knowing what this problem is because they have seen it, please dont' answer here. Please supply info to my email at af8c@arrl.net. If I get any useful info I can summarize it here.

Thanks 73 AF8C

I think my experience pretty much mirrors yours, but, I will take you for your word. However, I post to more than just the radio newsgroups and really wouldn't have the slightest idea from which group a spam bot would pick up my email address..... assuming I didn't use a disposable address with spam protection to boot.

Hey guys/gals, have in hand a number of P1225 UHF radios. Total of five.

3 units P94ZPC90C2AA, 1998 Datecode

1 unit P94ZRC90C2AA, 2002 Datecode

1 unit MISSING LABEL. Suspect it is 2002 as it came with other radio from
same source.

One radio has blue paint on front and I have a refurb kit on the way, which
will be included in the deal, free.
Other radios are excellent condition, no cracks, gouges or scrapes.
Chargers are also excellent. A couple of them appear as new.

7 batteries datecoded from '98 to '02 mixed.

3 rapid chargers

2 standard chargers

SOLD AS A SET: $1000

==========

ALSO:

2 units HT1225 LS version. Capable of 16 conventional UHF channels and
trunking. Includes 4 batteries, but NO charger.
I have not a clue what they will/won't do or even what they're worth.
They are in excellent condition and I expect to have them in hand Friday
when model numbers, etc will be available. I can have some conventional
channels programmed before shipment.
$275 each. Shipped CONUS.

Thanks and let me know via email!
Randy

BINGO! The newgroups have gotten a bad rap. I've used my real name and email since day one, and don't have much of a problem at all. I also use a Firewall, a dynamic IP and a proxy server on my home network. Just about the only spam I get now is the amazingly lame stuff where they take a username and add the .com, .net, edu, .org, etc to the end of it. This mostly occurs on my work address which uses 3 initials, a number, and an edu.

I probably get 3 spam messages a week on both my accounts.

"I also use a Firewall, a dynamic IP and a proxy server on my home network."

Those items have nothing to do with SPAM.

I've unfortunatley used my "real" address and the SPAM is enough to make me consider creating yet another new e-mail address.

> email address.....

Well, I did switch email addresses several times in a short period. And, during that time, also limited my newsgroup access to only a few groups. Because of that, it was fairly easy to spot when spam started in relation to the posts made. There was a period of time when I received my share of spam (6-7 a day). But, at that time, I had the address for some time and was posting to a lot of different groups. Since limiting my newsgroup postings, that is now only a few per week.

What is especially interesting is the type of spam as it relates to internet activity. For example, I'm suddenly getting a rash of "bankers" or "government officials" somewhere overseas who want me to help them transfer money (or something similar). Since I haven't gotten one of these in years, I'm wondering what started it now. It started after I posted in a couple scanner newsgroups, so it may be a result of those posts.

All this could be an interesting study for someone who can maintain a number of email addresses and post to only one group from each of those addresses over a period of time. Perhaps a perfect project for a college computer science student.

You're not kidding, Roger. Macromedia's Dreamweaver newsgroup is one such group. The tech people there will nag you endlessly if you don't top post. Other groups will nag if you do top post. In the end, I just do what I've been doing for years. What else can I do? If others don't like it, well... sorry about that.

I also use all of those things (I have the added advantage that I run Linux and am not concerned which viri or whatever other evil things are in the email). I've been using my real name and my real address since before the idea of spamming the net ever dawned on anyone. I get gobs of SPAM. But it is very easily handled with gnus under XEmacs, so that isn't really much of a problem either.

But I'm surprised that Mike says he posts with his real address and gets few spam messages. I did note that he has no signature, and that certainly helps... but I'm very surprised that his IP address in the headers isn't reaped just as often.

What I get, because I advertize two valid email addresses in the messages, is sometimes an easy way to immediately identify when something is a result of posting to Usenet. I'll get two identical emails, one for each address. That happens often when I happen to use google to do subject searches and post in groups that I don't normally frequent. Particularly if a message is cross posted to a lot "political" groups. Technical groups seem to be less of a problem.

Of course this can all be used for fun or evil too... ;-) Some years ago a particular group of net twits annoyed me. They were running a secret mailing list on the side, where most of the traffic was how to control newbies posting to a specific newsgroup. I happened to find out about it, and added a 4 line signature to a few posts for a week or so that read: "SPAM targets: ..." and had a list of about a dozen addresses. Every other address was that of a spammer, but every odd address was the mailing list. I warned my ISP (I did consulting for them) that they were about to get a complaint, and they about died laughing at the two that did arrive. Tsk tsk, seems it flooded the bozos with SPAM.

Hey all, Have for sale 2 Kenwood radios.

They are TK-862 models, 2 channel, UHF and include brackets and microphones.

Both radios are in good to excellent cosmetic condition. There are no screws for the brackets. Microphones have some yellowing.

One radio is an "H" model, meaning High Power, 35w. This radio has a cut power cord, but there is about 5" of cable to splice. Radio works fine.

Second radio is standard model (25w). This radio has a blown power module but RX side is fine. Use for parts or fix. I believe the module is about $60-70.

$150 for both, plus shipping, or trade for motorola gear.

Thanks!
Randy

Don't EVER use an ohmmeter to test a mixer diode. You'll blow it to H
and back! There are special testers made for such things. The AIL
model 391 is one such tester. I'll post a picture of it in
alt.binaries.pictures.radio. Good luck.

> Has anyone seen any sites or news postings which compare and
> contrast the Icom and Yaesu transportables?
>

I haven't seen any direct comparisons made. However, personally, I don't think the two are equivilent. The 706 is a small high powered radio made for mobile use. The FT-897 is a somewhat larger unit made for "portable" operation more than mobile operation, though it would work well for a mobile, I'd think. The FT-897 has features for a built in AC supply, or a built in battery intended more for portable or fixed operation. Th IC-706 runs strictly on 12VDC.

The new Yaesu FT-857 would be a more direct competitor to the IC 706.

I use several techniques:

1. I use a "non standard" newsreader and mail program. Outlook and OE are verboten to any of my computers, and for my kid's computer. If my progam were to become popular, I'd switch to something else.

2. Ad-Aware is run daily. I don't get many hits on it any more, but when I do, the site or program that put the little bugger on my computer is ignored or the program removed.

3. I have a list of nasty IP's that get directed to null. I hope people know that they often visit these sites in the form of banners. Bad stuff, and the banners and such are on some pretty reputable sites.

4. I have to accept some cookies. Only ones that go back to the original sender tho'.

5. Instant messenger programs aren't allowed on my machine.

6. File sharing programs are not allowed either. (try running Kazaa after running Ad-Aware. It won't run unless their Spyware is on your machine.

7. Surveys and other nonsense are not filled out.

8. Finally, Free is not! I'm not talking about good freeware, like the many fine amateur radio programs that are available for download, but "Free" sites where you go to them, watsh an animation, and get your computer pumped full of goodies! I recently spent some quality time purging a friend's daughter's computer of lop.com recently. It had integrated itself quite nicely into her system. On the same computer I cleared out over 200 instances of spyware. I installed my security programs and proxy server on it, and there has been a marked improvement in performance and spam.

While these things supposedly "are not related to spam", What can I say? They seem to work for me. The interesting thing is how many people who have spam problems are the same ones who post anonymously, or with faked addy's.

I'll accept the judgement that I am wrong, but can someone come up with a valid reason I don't get spammed? (short of saying I'm lying, which I'm not) ;^) I think that we are sharing more with the bad guys than we think we are. Go figure!

Cliff is correct. The lpl loop is unlocking. I forget the actual adjustment but its listed in the service manual. Not likely any failed parts but an adjustment of the lpl lock voltage.

Symptom: No RX/TX when cold or warm. May have dead spots in tuning range of each band.
Probable Causes: PLL unlock.
Cure: Align LPL lock voltage on PL unit.

The symptoms are quite common of Icom's of that pll design, HF through UHF.

I have the following microwave connectors for sale; all are new, sealed
in original plastic pouches:

1. OMNI SPECTRA 2056-0000-02 7
SMA Female, Panel Mount to Solder Cup
Includes washer & nut; Gold-plated center
(85pcs@$85 total) or $15 per 10pcs
2. OMNI SPECTRA 2056-0000-00 7
Same as above, but entirely Gold-plated
(8pcs@$15 total)

3. OMNI SPECTRA 2007-7941-02
SMA Male to Right Angle Cable
Half of body is Gold-Plated
(10pcs@$20 total)
4. AEP(ALLIED ENGINEERING) 60-9921-141
Identical to above
(43pcs@$65 total) or $20 per 10pcs

5. OMNI SPECTRA 2052-1300-00
SMA Female Panel Mount to Solder Cup
Mounts by 2 screws; Gold-plated
(6pcs@$12 total)

6. SEALECTRO 50-051-0000
SMB Female to PC
5-pin PC connection(hot & 4 ground pins)
Gold-Plated
(131pcs@$95 total) or $15 per 10pcs

7. SEALECTRO 50-045-0000
SMB Female Panel Mount to Solder Cup
Threaded on both sides; includes nut
Gold-plated
(86pcs@$95 total) or $20 per 10pcs

8. KINGS BNC Female Panel Mount
(130pcs@$95 total) or $15 per 10pcs

9. DIN Plugs; 3-Pin Male
Black plastic w/stress relief
Loose packed
(1000pcs@$95 total) or $15 per 100pcs

Prices do not include shipping($4.30 for Priority Mail & Delivery
Confirmation on small orders)
E-mail or call (323)851-8844

FOR SALE:

Swan 350 transceiver with 117XC power supply/speaker cabinet.
All in good operating condition with manual.

Power input 400 watts PEP on single sideband, and 320 watts input on CW.
Also will run AM, Single Sideband with Carrier, 125 watts dc input on all bands.

Has AGC, ALC, and grid block CW keying. Unwanted sideband down at least 40 db.
Carrier suppression at least 50 db. Sensitivity: Less than 0.5 uV for signal-plus-noise ratio of 10 db.

Controls for Rec-Tune-CW, AF Gain, RF Gain, Mic. Gain, Bandswitch, Carrier Balance, PA Plate Tune, PA Grid Tune, PA Load Coarse, PA Load Fine, VOX-PTT Switch.

Rear controls for Bias, Grid-Block CW Key Jack, Jones plug power connector, Vox connector, S-Meter Zero.
Uses a pair of 6HF5 finals.

When the 350 was introduced in 1965, the price was $420.00, the 117XC was $95.00

Swan 350 available for $195.00
Swan 117XC available for $85.00
Swan VX-2 is available for $35.00
Will sell the Swan 350 and 117XC for $250.00
All of it for $270.00

E-mail me for pictures or see:
http://www.gizba.com/x/sidevalve/radios.htm
(Just CLOSE the pop-up windows!)

I just acquired a r-390/urr and after plugging it in it lights but no receive audio.on the rear of set is a remote control connector pins a-k. do any have to be shorted to get receive, seems as if radio is being muted and carrier level meter is pegged at 100 db. any and all help would be appreciated.
also I cannot return the radio because I trash picked it. good find if I get it to work.

2379. FS:Icom IC-756

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-07 19:38:26 UTC
From: Bob Stamper <bobstamp@bellsouth.net>
Message-ID: <mq6aa.2171$h9.708@fe09.atl2.webusenet.com>
Source record: 32611

I have for sale an Icom IC-756 original model.The radio is in excellent condition,a solid 9 in
appearance and works 100%.The radio comes with the HM-36 mic,power cord,manual,original box and two
optional filters.The filters are:
FL-222 a 455 KHz IF, 1.8 KHz narrow SSB.
FL-223 a 9 MHz IF, 1.9 KHz narrow SSB.
The filters alone cost $300.00
The radio has been in a non-smoking environment and has no dents,scratches or evidence of wear.
Asking $1000.00 + about $20.00 shipping.I will ship to the lower 48 only.I accept USPS money
order,certified bank check or a personal check with a 7 day hold.

Regards
Bob Stamper N4KTS

Do you have a manual? There are some jumpers
on the rear terminal strips that need to be there.

Great trash picking find! I hope it was curbside and
you did not have to lift it out of a dumpster :-)

good luck & 73,
Phil

My guess would be that the ballast tube (3TF7) is blown. Locate on the
chassis and check to be
sure it is intact. You should be able to see if the filament is intact.
If it is broken, you can insert a 10 Watt 50 ohm resistor in the two
holes used by the 3TF7. This will get it working.
Nice find. It is considered better than the more common R390A/urr.
I would suggest joining the R390 Reflector at qth.net. A really
knowledgeable bunch.

Do you have a need for a high-quality SMA-to-BNC antenna adapter that
is custom made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change antennas to base, mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to antenna
changes.

Adapter features:
Gold plated contacts with a teflon insulator.
A low profile design with a rubber covering for a factory antenna look.
The rubber base seals to the top of the radio with no spacers needed
for moisture and dirt protection.
The base also provides an excellent support for any length of antenna
or application.
No need to remove adapter once installed to make a quick and safe
antenna change.

Sizes to fit radio models:
Yaesu: VX-5R, VX-7R, VX-1R, FT-50-R, VX-10, VX-150, VX-110,
VXA-100, VXA-120
Icom: IC-T90A, IC-T8A, IC-T81A, IC-Q7A, IC-R2, IC-R5
Kenwood: TH-D7, TH-G71, TH-F6A, TH-F7A
Alinco: DJ-V5, DJ-X3, DJ-S40
Standard: C508A, C510A
Radio Shack: HTX-420, HTX-400, HTX-245, HTX-200
Aor: AR-16

Previewed in the May 2000 Issue of CQ Magazine, and the Nov. 2000
Issue of QST Magazine.

$11.95 + $1.50 S+H(One to unlimited)
(Check or money order only in U.S.Funds)

Those do match the symtoms of a "mute" line not being shorted. My
drakes act the same way if you unmute them. IE: S meter pegs as if you
rolled the gain all the way back. I don
t know what those connections are on the collins, but surely someone
out there knows being those were fairly common. On all the older
drakes, the mute line is called "mute". I don't know if I would be
keen on just willy nilly shorting pins to test. I would try to find a
manual or someone who has one that knows first. Doesn't really sound
too serious whatever it is. Should be a keeper if it's lighting up
with no smoke. MK

I have an AL-811H which works fine on SSB and CW. In RTTY, I can't get the amplifier output above 200 watts and keep the plate and grid current below the max values specified in the manual.

Anyone else see this before? Any ideas as to cause?

It's worth sacrificing a little self esteem when you can find a receiver
like the R-390 in someone's trash! :-)

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Greetings All:

A complete copy of the UNIVERSAL RADIO EQUIPMENT GRADING STANDARDS (UREGS) is now available at:

http://www.parismtnsignco.com/uregs.htm

Hams trading sites are already using the UREGS. You are invited to have review them when you have the time.

If you have any constructive suggestions for improving the UREGS, please free to send them me or any other member of the UREGS team.

A few have voiced a concern that the standards are lengthy. This is because of the requirement that they be applicable to ANY radio equipment.

Thank You!

The UREGS Team

The introduction says these standards are to be used for VISUAL evaluation.
Why isn't the operational condition considered? Maybe your new system should
be revised to include this important criteria...

>
UREGS grading is based solely upon the visual condition of the equipment
determined through a close visual inspection of the equipment. This grading
standard may be applied to any piece of amateur radio equipment, and does
not rely upon equipment reviews, marketing information, or any other
external subjective resource.

Hi..

A while ago, I built a cable to connect my Alinco DJ580 HT to my Kantronics KAM TNC. I no longer have the KAM or the DJ580, but I still have the cable. The cable is DB-9 Male on one end (to plug into the KAM VHF port) and two connectors on the other end...one miniature and one sub-miniature to connect to the speaker out and microphone in of an HT (a DJ580 in my case.)

Send me $12. (check or paypal) and you've got it! I'll pay postage to anywhere in the USA.

If interested, send email to "ken@NOTwinograd.com" (take out the "NOT" and the address is for real.) We can then swap details. I'll accept a check or Paypal.

Thanks

Ken

(Maybe *someone* in all these newsgroups knows how
to do this -- the resulting info will hopefully
be useful to readers of each of these many, many
newsgroups.)

Am listening via net streaming-audio to an important
meeting 3000 miles away, and need to tape it, if
possible.

The pc has an earphone/headphones out, which works
fine, super quality sound coming out.

I also have a sony walkman-like casette-player/recorder,
and that has a "mic" (microphone, presumably) input
socket right next to its headphone out.

I want to use that wee machine as my tape-recorder.

(No, don't have the user-manual, which would
give me the specs for it.)

Surely there's a *huge* voltage mismatch,
tiny voltage generated by sound-waves hitting
the mike, vs what it takes to drive the headphones.

To say nothing of the impedances.

QUESTION: is there some, er, "bridge" that
I can buy that will
connect the pc's headphone-out to the
walkman-like recorder's mike-input?

If possible, I vastly prefer to not be forced
to build such a thing -- especially with
no more heathkits available!

(I just called the local radio shack, and their
"expert" said he knew of no such device.)

Thanks so much!

David

Well, I once connected the headphone output from a turntable into the microphone input of a small tape recorder through a 47K resistor - worked perfectly and cost nothing. :^)

Hmmmmm
More info is needed for concrete answer. Mic input sensitivity depends
on the kind of mic (electromagnetic or electret, etc), sound card output
level is also not standard, but you can imagine your souncard output is
around 0.1 Vrms (which is a kind of standard for AUX-IN for amplifiers)
and the mic signal is mV range. so you need a voltage division by 100
... If I were you, I would take a 1K potentiometer, and woud use the
middle pin and common pin(Ground, shield) as mic input, after a few
trial and error (start by division by 100) you will hit a suitable point
by potentiometer.
Do take good care of shielding to avoid unbearable noise.
Good luck

Rat-shack sells attenuating cables.

You may, however have to get a stereo-to-mono adapter to
tap into the thing, or just a stereo splitter to get a
mono jack. Plugging the (mono) attenuating cable into the
stereo jack will short one channel. The S-2-M adapter
just ties them together, which is okayish, but the splitter
will be your best choice. Since your meeting is presumably being
streamed in mono, pulling either channel in would be fine.

Tell the drooling droid at RS:

Part number for Stereo-to-Mono adapter: 274-374
Part number for Stereo-to-Mono splitter (preferred): 274-375
Part number for attenuating cable: 42-2152

You may be able to buy an attenuating cable. You might even try hooking up the audio-out from the PC directly to the mic input of the tape recorder using a regular (non-attenuating) cable. I've done that in the past and it worked OK - of course that's no guarantee that it would work for _you_.

You could also try using a few resistors to build a simple voltage divider that would lower the output voltage from the PC.

Thanks for taking the time to comment.

Perhaps that section could use some rewording. However, if you read the rest of the criteria you will see that functionality is VERY important to grading the equipment.

Cheers,

The UREGS Team

I have for sale an Icom W-32A in as new condition. With the exception of clear tape I place over all of my H/T and scanner display lenses to prevent scratching (easily removed) the radio looks as it did when I originally purchased it from Lentini Communications. The radio has never been in a smoking environment.

The H/T will be shipped in the original box with original manual and quick-reference card. Comes with stock antenna, battery and charger (approx. 1 year old).

I am asking US$190.00 O.B.O.

Please e-mail direct if interested or for further information.

Thank you,
John, KB2COP

Source record: 32569

Final 73s to W2ZLM Marty Enghauser... Marty passed away recently after 50+ years on the air. He left a lot of old equipment behind which I'm trying to dispose of, listed below. All equipment works fine and in most cases we still have the original user manuals. Equipment is located in the Northern Virginia suburbs of DC. Can arrange for interested parties to come by and view the equipment if desired.

You can post responses to this newsgroup but direct email would be better.... petee100@aol.com.

Thanks, Pete Enghauser N4ACQ

- TenTec Omni-D Transceiver circa 1978 - 10, 15, 20, 40, 80, 160 meters.

- Henry 2KD-2 2-Amp amplifier circa 1968

- Hallicrafters HT44 transmitter - circa 1962 - Should work okay but may need some vac tubes.

- Hammarlund HQ180A general coverage receiver - circa 1962 - a little beat-up but works fine.

- Heathkit HW-16 CW Novice Rig - with 6 or so original crystals.

- Mosely TA-33 beam - 10, 15, 20 meters - circa 1968 - Tower has been standing in the yard for 35 years. A little rusty and the crank cables need to be replaced but otherwise still sturdy. The beam itself is in pieces (one element fell off) but all pieces accounted for and seem fine. Relatively new rotation motor (10 years old?) and control box. Am planning on digging it up sometime soon. Will give it away if someone wants to help dig it up and/or haul it away.

- All kinds of miscellaneous bits and pieces - mikes, keys, speakers, etc.

I've been using one of these for the past six months for Volunteer Fire and EMS work. In fact, I have it listed for sale/trade on some of the News Groups.

The following page gives a lot of information on this radio:
http://mmi-comm.tripod.com/fth2070.html

The one I have was programmed in the ham bands when I bought it and it seemed to a good job. I could hit just about every repeater, both 2 meter and 440, that it was programmed for.

It is now programmed on our VHF fire and EMS channels as well as the UHF Med channels. I use the radio just north of Louisville, KY and have had no problems with operation in a congested RF environment.

My negative comments on this radio are it's size and weight. With the high capacity battery, this thing is a pain to carry around for 8 to 12 hours. However, for Public Safety use, it's built like a tank and provides dual band capability. Much better than trying to carry two radios.

What you need is an impedance matching circuit. Simplest thing
is to go to Radio Shack, Fry's or some other electronics store
(Best Buy might even have it) and look for either an attenuator
or dubbing cable.

If you really wanted to do it yourself (though you probably won't
save anything over buying a low-end ready made cable or plug)
a non-polarized electrolytic capacitor and a potentiometer would
do. (You could use a resistor, but since you don't have the specs,
might as well make it adjustable - a tiny pc-mount pot would do.)
You can buy a cheap cable with the appropriate plug and socket,
then cut it in half and wire your circuit into the middle. Do a web
search and I bet you find sample circuits.

Here's the circuit I've used. Value of the parts isn't super critical. A
,47 uf cap and a 1K pot are probably fine. Connect the shield (outer
conductor of the cable) from the input to the output and to one
side of the pot (the middle connection on the pot is the wiper, you
want one of the side connections). Connect the other side of the
pot to the input cable's center conductor. Connect the capacitor
to the wiper, and connect the other end of the capacitor to the
center conductor of the output cable. Done. Center the potentiometer
and hook it up. Adjust the potentiometer until you get a decent
recording level. It's crude, but it works (usually). You might have to
go to a 10K pot (doubt it), or down to a 500 ohm pot, but IIRC,
1K works for most headphone outputs. Mostly what you have is a
voltage divider that drops the voltage to something the mic input
can handle.-Wm

you should be able to get a lenght of threaded rod 3/8 24 at your local
home depot
then you just cut you some stubs

I have one - like it very much. Some observations.
Don't expect a lot from the HF or SWL bands. Needs external antenna to pull
in anything.
Antenna supplied was somewhat deaf on 220 MHz -- so I bought a Comet
HT-224 -- works a lot better.
Otherwise it works well.
I got the programming cable -- saves a lot of frustration in programming.

Also see e ham reviews http://www.eham.net/reviews/
Also was in QST I believe -- http://www.arrl.org/members-only/prodrev/

2451. Icom IC-F420 Mic Wiring

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-09 14:55:43 UTC
From: "Michael B. Blake" <k9jri@sbcglobal.net>
Message-ID: <PBIaa.5561$se1.3004121@newssvr28.news.prodigy.com>
Source record: 32580

I would like to connect an alternate mic to my IC-F420 radio that I am using in the 440 mHz. ham band. The owners manual for this 32 channel UHF Commercial radio is a simple operators guide and contains no technical information. I know that the supplied HM-100 mic has standard Icom 8 pin modular wiring for the Mic and PTT leads but I am concerned about the functions of the remaining connections.

If anyone can provide me with the designation of each of the 8 pins on the IC-F420's modular jack I would appreciate it very much.

2452. Any interest in yet another Syntor X controller?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-09 15:27:04 UTC
From: "@home news" <freebsdfan@hotmail.com>
Message-ID: <c3Jaa.134504$XB3.109240@news1.west.cox.net>
Source record: 32584

I've recently designed and built a simple minded Syntor X code plug replacement that allows external control of operating frequency and PL. My primary aim is to allow a Syntor X to be used in a remote base with complete control of frequency and encode/decode PL tones from a control system.

Unlike other Syntor X controller projects I've found on the Web (Piexx, Anaconda X, k3jls) my interface does not require trace cuts and only requires a single soldered connection. The rest of the interface simply plugs into the EEPROM socket in the Syntor X memory module. The Syntor could be restored to it's original condition in a couple of minutes.

Although my primary interest is for remote base it may also be useful for mobile applications as well. Mode 1 is used as a VFO if you will, but modes 2 to 32 are available for normal usage. The computer interface can be used to recall the contents of any mode into mode 1 for modification. Once modified it can be stored back into any desired mode. Modes are stored in flash memory and are nonvolatile. A simple LCD display and keypad could be created to complement a standard Motorola Syntor X control group if desired.

Currently my software implements the Icom CI-V protocol. I'm investigating changing it to be compatible with the "Doug Hall" RB-1 "generic data" protocol which I believe is supported by a wider range of control systems. My target controller is a link comm rlc3, but I'd like to make it compatible with as many controllers as possible.

This interface has the potential of being very inexpensive. Currently it consists of a single PIC microprocessor and a crystal. Although the interface is simple it still required most of a day to build, debug and install. Since I need several I'm considering laying out a circuit board to make construction easier and faster. I've done a few kitchen sink PCBs and I've had my fill of them ! If I do a PCB I will have it fabricated by a professional board house. Hence (finally!) the reason for my message ...

Would anyone be interested in purchasing a kit consisting of a programmed microprocessor, PCB and documentation for around $40 ? I would also include a Windows program that could be used to control the Syntor and modify mode data.

I'm not expecting to make any money on this project, just recoup the setup charges for a small run of PCBs.

I chose the Syntor X primarily because "one followed me home". On the other hand I think it was a good choice because the original Syntor wasn't broadbanded and the Syntor X 9000 is in too much demand to be dirt cheap just yet.

2465. Kenwood TR-7950 users

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-09 20:10:39 UTC
From: Benny Miller <bennymiller@core.com>
Message-ID: <v6n7u4k56hf0f2@corp.supernews.com>
Source record: 32597

Just a quick question. I have a Kenwood TR-7950 and its manual. In the manual it says the following

S/RF Level Meter - This LED level meter indicates relative receive input signal strength or transmit RF output.

My question is, when i receive a good signal, the Meter lights up all the way. When i transmit, if my antenna is in tune, should the lights go up all the way? I have a J-Pole at 1.3:1 that lights up about 3 bars and a 3 element Beam at 1.5:1 that lights all the way. I have the high power selected.

Is the meter supposed to go all the way up to red when transmitting through a decent antenna? Or, is the meter reading reflected power......where going all the way up to red would be a bad thing.
Thank you.

I have tried both AFSK and FSK. I can run full power RTTY (both AFSK and FSK) from the exciter with no problem. The amp just hits the current limts specified in the manual before it develops more than 250 watts.

I am now suspecting that the I need to fine tune the input circuit.

Source record: 32451

At full output into a matched antenna (or dummy load) the
LED meter should indicate full scale. If it indicates only
3 bars, that is about 5W. Check that you have a low SWR,
and that the "Low power" button is not depressed. If it
still indicates only 3 bars, there is a problem with the driver
and / or final. It might be as simple as a mis-adjusted low
power limit pot, or might be a loose connection, or mis-adjusted
final bias pot, or mistuned driver stage, or ...

I have two of these radios. Nice radios. Excellent for packet.
When they get old (and they are ALL old now) things start
to drift and wear out :-)

2471. Frontier Electronics Ham Rig Question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-10 00:38:21 UTC
From: Dan V <davander@attbi.com>
Message-ID: <18Raa.27204$6b3.104968@rwcrnsc51.ops.asp.att.net>
Source record: 32453

Back in the 70's, I had a rig made by Frontier Electronics of Tokyo Japan.

It featured ssb/cw coverage of 80 - 10 meters, 100 watts output. It was a hy-brid, solid state receiver, and tubes in the transmit side...12BY7A driver and 2x 6146 finals. (Like the Kenwood TS520 later on)

I've never seen another one in all these years, and can't find any info on it on the web. Anybody know anything about "Frontier Electronics" rigs??

Hello!

The Eastern Idaho UHF Society in conjunction with the Eagle Rock Amateur Radio Club will be having an ARRL Sanctioned Hamfest in Idaho Falls on April 26th. We have an Event Web Page with up-to-date information. URL is - http://myweb.cableone.net/wa4vrv/hamfest.htm. Many talks as well as VEC testing for all license classes. Main door prize will be a Kenwood TH-D7A(G)HT. Many more door prizes. Check out the web page.

Jay, WA4VRV
Hamfest Chairperson

> model number any deeper inside?

There "should" be a sticker plate on the back of the radio, above the battery compartment cover. It would list the Model number, the FCC ID number, and the Serial number. If you see a little smooth square recessed area a little bit bigger than one square inch on the back, this is where the ID plate should have been, and it is missing.

thanks to all who replied or thought of replying, I didn't just turn the radio on and sit in front of it and stare at it, I turned knobs turned switches trying to get it to do something. I have been a ham for 25 yrs and have a basement full of radios and know how to tune and operate most but this is the first time I have had the pleasure to lay my hands on a '390'. did get a nice e-mail where to find the manuals and since have downloaded all 3 manuals and a lot of hints and kinks from the i-net. now it is time to dig in and start signal tracing. also I got a few e-mails that stated "if you don't want it I'll buy it from you",I never said it was for sale? I asked for help to get it going, some in the ham community never cease to amaze me.any how I am welcoming any and all help from r390 users and especially those who know the inards of this classic rcvr.I will keep posting on my progress and ask questions as they arise. As far as the amp is concerned rtty and cw with the key down are the same thing. You might be looking at the max current for rtty which could be differant as it is a 100 % duty cycle and is rough on tubes. If you have the 3 tube version that could be the maximum recommended power out in the rtty mode.

No probably when the dial was installed it was just pushed a little
harder against the tension adjustment assembly. Pull it out a bit and
it should loosen up.

My Mirage amp is missing its grommet/strain-relief. This is the
two-piece, tapered black plastic piece that clamps over the supply
wires and locks into the chassis hole.

Mirage doesn't stock the part.

Does anyone know what this do-hick is called and where I can buy one?

They are used on all kinds of appliances (like battery chargers and
fans), but I don't want to cannabalize something that is working and
it could be years before something having one dies.

If that is an ATX power supply, it is fairly easy (meaning I know how
and can describe it well). I'm not sure about an AT supply though.

What kind of a connector for the motherboard does it have, and what
does the label on the side of it say about the ratings for the 12 V
line, the 5 V line and the 3.3 V line? It should list the max current
for each one.

2489. Audio problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-10 14:43:44 UTC
From: Bill Ogden <ogden@us.ibm.com>
Message-ID: <3E6CA49F.893F59A5@us.ibm.com>
Source record: 32468

This is not an amateur radio problem, but there are lots of experts here
so I will present my problem.

A church PA system has a problem. It uses two what appear to be
electret microphones connected to a 100 watt Realistic amplifier.
Generally it works well, except for a very low hum.
The problem is static electricity. When someone walks (a little shoe
dragging helps) on the alter platform and then touches one of the
microphones, there is a loud pop/static/crunch sound. I could touch the
microphone several times, creating the problem, until I was completely
"discharged". After that, there is no problem until I walk a little on
the carpet again. (The problem is worse on a cold, dry winter day.)

I connected a wire to the offending microphone stand and tried
connecting it to anything that might be grounded, including the third
pin of several power outlets. Nothing helped. (Opening the outlets, it
seems that there is no ground wire in any of them and the utility boxes
are not connected to anything that might be a reasonable ground.)

The microphone connects to a large three-pin connector (what I would
call a "professional" microphone connection) but then goes into a thin
wire (I hesitate to call it a "cable") in which I can see twisted
wires. It is about 30 wire-feet to the amplifier. I expected to see
the heavier cable that I usually associate with these microphone
connectors. I assume the thin wire is shielded; otherwise I would
expect much greater hum. However, whatever shielding there is does not
seem to handle the static electricity problem.

Has anyone worked with a similar problem?

Bill

>AF4GC

I've got one that has 31 A capability at 12V. I don't know how
high the 12V rail can be adjusted, so I'm not sure if it could
hit 13V much less 13.8V, but I doubt that is terribly significant.

It could also very likely be arranged to be in series with either
5V (25A) or the 3.3V (30A) supply too.

Hence this particular supply most certainly could power a device
requiring 13.8v at 20A.

An older, smaller AT supply (which is probably what the OP has)
most likely will not have the current capability, but it is not
correct to say that computer PSU's in general do not have the
capability.

That aside, a very nice Pyramid 25A battery replacer runs about
$80 or so.

They're just called strain reliefs. They come in different sizes for
different power cord diameters.

The largest manufacturer is Heyco.

A Google search (http://www.google.com) for 'heyco "strain relief"'
comes up with 491 hits.

The computer PS won't supply nearly enough current at 12 volts. There should be a label that gives the current rating, but the plus and minus 12 supplies are just used for RS-232 lines and small motors, so only 2 or so amps available, even on a large supply.

The type of supply for the Icom does not matter, except... switching supplies sometimes radiate noise in the RF spectrum which may interfere with the receiver, or might modulate the transmitted signal.

>the way?

If you have the high power option selected (45 watts), yes.

> I have a J-Pole at 1.3:1 that lights up about 3 bars and a 3
>element Beam at 1.5:1 that lights all the way. I have the high power
>selected.

The beam is presenting a good match to the transmitter; the J-pole is
not (despite your separate, questionable SWR readings). The higher the
LED sequence shows on the scale, the greater the transmitter output.

>Is the meter supposed to go all the way up to red when transmitting through
>a decent antenna?

Yes. But if the rig senses a problem, it cuts back on the output power
to protect the final. See the note in the manual on page 7, second
column, second paragraph.) The fact that you get full scale on the
beam on high power tells you that all is working fine with the rig.

>Or, is the meter reading reflected power......where going
>all the way up to red would be a bad thing.

No. On transmit, this is a power output meter, as spelled out at the
top of page 10, first column, in the manual.

The -12vdc line is indeed low current. The +12vdc line might well
have 20A capability. Or more likely there will be two +12vdc lines
with a combined current rating of more than 20A.

Yeah, yeah, but did you figure out if you needed a jumper on the back to get
it working, and if so, did you try it yet??? Inquiring minds want to know !

Believe it or not, my local Radio Crap has them hanging on the wall. Not sure if they're for #18 zipcord or something else, but if they carry them, you can be sure to get the proper parts elsewhere.

They are called "strain reliefs".

Hey, I have a mild hernia, surgery was not suggested, but, I suspect
I would hurt myself lifting that sucker in to the car.
All that is on the curb around here are old washing machines and
rusted out grills. A R390 on in the trash. I am living in the
wrong part of the world!
I hope he gets it going.

These are the cables that go between the radio's and the RICK unit. They are brand new, I also have two of the mic plugs used for to close the squelch when radio is being used as a repeater.
First $20.00 takes them.

I don't drive a car, so finding an R390 would be problematic.
I sure wouldn't leave it there, but it sure wouldn't be easy getting
it home.

I once did pass a Tektronix scope waiting for the garbage truck, and
since I have one as old as I am, and I wasn't going to take it, I
didn't even bother to look closer to see the model number.

You make the sacrifice for the things that are worthwhile,
and leave the things that merely tempt you because it's a shame
for the stuff to go to landfill.

Hi,
Really? SP-600 is big, HQ170/180 are big, SX-28, SX-62, SX-88, R-392,
NC-303, NC-300, SX-96, AR-88, CR-88, etc. They're all big. Old radios
are all BIG, hi.

2514. FS: Yaesu VX-3000V 2 meter rig plus

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-11 02:39:52 UTC
From: WZ1U <wz1u@attbi.com>
Message-ID: <2ciq6v4njd1v6u9t41rgn6fbr21qucicmq@4ax.com>
Source record: 32496

Here is a commercial 50 watt 2 meter mobile rig. It comes with the original manual and mobile bracket. Also have the optional Yaesu software package CE-19 programming software (for IBM PC compatibles only) and the VPL-1 programming cable. This is not a copy, but the original software. It covers 134 to 174 Mhz with 48 channels and the rig is in excellent condition. I will take $300 plus shipping and can be reached at (508) 821-2993 or email WZ1U Steve / Lakeville, Ma.

Below is the specifications for the VX-3000V

VX-3000
4/48/120 Channel LVHF/VHF/UHF Mobile Radio
When it comes to feature rich mobile, the VX-3000 fits all the requirements of public safety and commercial users alike. Whether the basics, for a fleet of school buses, to alphanumeric capabilities that meet the high demands of Public Safety. The VX-3000, rugged and reliable unit, allows all the flexibility you need.

ï¿½ Frequency Range:
Lowband: 37-50 MHz
VHF: 146-174 MHz
UHF: 450-490 MHz
480-512 MHz
ï¿½ 4/48/120 Channels LED or LCD Displays
ï¿½ 8 Character Alphanumeric Display (48ch & 120ch version)
ï¿½ 70/50/40 Watts Power Output
ï¿½ CTCSS/DCS
ï¿½ Two Tone, 5/6 Tone with ANI
ï¿½ 12.5/25 Bandwidth
ï¿½ DB-9 Connector for Data Applications
ï¿½ 3 Year Warranty

That was the first place I went. They said they didn't know what it
was and they didn't have it. Doesn't show on their web site either.
But that's been the story for half their components ever since they
redid the stores.

Next time you are there, I would appreciate your checking the part
number and posting it.

Tnx.

No. In my experience, they are very reliable. Once
working, they need little maintenance.

>supplies?

I once ran a 10 watt UHF FM transceiver from a PC power supply. It
was used for packet and the signal must have been "good enough."
That was with strong FM signals, not weak CW/SSB.

There are a few things to remember:

Switching supplies generate noise. Many PC supplies skimp
on filtering, both on the AC power line side and the DC output side.
That works for the average PC, saves money and boosts profits.
It will not work well for your application.

Also, you may get reduced output using 12 volts instead of 13.8.
You can try the three 5-volt outputs in series thing, but that doesn't
take care of RF noise, and you need 3 power supplies.

And most PC supplies need a minimum load on the 5 volt output to
work properly. Not difficult, just something to you need to do.

If the supply has enough current on the 12 volt output, add series
inductors and parallel capacitors for filtering and let us know how it
works out. Don't forget to put a load on the 5 volt line. Don't know
how much is needed to make it work right.

I bought the TS-2000 just a few weeks ago and plan to upgrade it to include the 1.2G module in the not too far future. Performance and quality both seem great. Haven't had it long enough to count on durability.

The main thing is it takes time to learn all the features. It's not aimed at the new radio amateur.

Sometimes yes, sometimes no.
It depends on what they have for a browser and how it's configured.
If the browser is configured in a simple straight forward way with all
addresses legit, you can usually tell.

> sag!

I own several of the commented BAs (SP-600, R-390A, R-388, AR-88D, ...
more at http://jvgavila.com) and heaviest one in my collection is the
AR-88D. I can move by myself all the others but the AR-88D is out of my
possibilities. And, on the other hand, has a great audio and very good
stability... weight related?

And, of course, I would use the ABS if I see an R-390 on the street :-)!
(or any other BA)

Regards,

JOSE

Source record: 32513

I have for sale an Icom W-32A in as new condition. With the exception of clear tape I place over all of my H/T and scanner display lenses to prevent scratching (easily removed) the radio looks as it did when I originally purchased it from Lentini Communications. The radio has never been in a smoking environment.

The H/T will be shipped in the original box with original manual and quick-reference card. Comes with stock antenna, battery and charger (approx. 1 year old). I am also including a registered/original RT Systems programming software disc with documentation as well.

I am asking US$190.00 O.B.O.

Please e-mail direct if interested or for further information.

Thank you,
John, KB2COP

Hi,

I am looking to buy the following Eaton/Ailtech/Singer/Stoddart antennas. They must be operational, and be in good shape. Here is list:

1) 94623-1 1-18GHz horn antenna KIT. It is used with the NM-67 and consists of 5 different antennas with reflectors and mounting adapters. It would be nice if it had the transit case, but I will take it without. But it must have all antennas, reflectors, and mounting brackets.

2) 94592-1 Rod antenna coupler 10Khz to 32 Mhz

3) 94607-1 Rod antenna preamplifier

If anyone has any of these lying around the shop, and would like to part with them, or if you know anyone that has them please e-mail me at:
maxshiloh@yahoo.com
Thanks

I'm going to make you folks weep with rage and grief.

When I was outprocessing from a TDY at Osan AB, Korea, back in 1969, I walked by the MARS shack as they were tossing *several* R-390s (non-A, IIRC) into a dumpster. I was told I could have as many as I wanted, but my hold baggage was already en route, and there was no way I could lug one onto the plane. *sigh*

"You've got questions, we've got blank stares."

I've seen some RS where they have the part, but none of the sales
people know that they do, or what you are talking about. It's far
simpler to find it yourself than have to explain what it is to the
salesperson.

The focus seems to be on selling you a cell phone, satellite TV, or RC
toys. Few of their salespeople learn any more than that.

Happy trails,

A major warning, if you have to disassemble the mechanical gearing
(i.e. removing the RF deck). There should be a "GREEN" gear attached
with a screw to the frame. It is needed to maintain sychronicity of
the gears with the rest of the radio. If you remove the deck without
it properly mounted (per the book), you'll NEVER EVER get it aligned
up again.

ISTR the 390A didn't have said gear.

And there is a guy on the internet who overhauls 390's for a flat fee
of around $500, which is a good investment. This receiver still
outperforms anything built these days, except for the lack of a
product or FM detector.

If that guy is Chuck Rippel, he does excellent work and found an intermittent problem on my 390A that I'd been trying to track down for ages (and two other techs had told me didn't exist).

If anybody has an outboard product detector for these things, I would really appreciate hearing from them. I considered trying to build a homebrew with a sheet-beam tube but too many other things got in the way.

>(No, don't have the user-manual, which would
>give me the specs for it.)

Here's how I did it, the line out from the computer to a 25 year old
Panasonic "shoebox" cassette recorder's microphone input.

```
+---------
| mic in
Left --/\/\/\----+ .01 uF V
Right --/\/\/\----+-----||-------/\/\/\--+----
56k ohms (both) 10k ohms |
gnd |
----------------------------------------+
```

The very small capacitor value is to compensate for the huge bass boost on
the input. Given the age of the recorder, I assume that, although it has
a built in electret mic, the external input was for a dynamic microphone.

Source record: 32527

If you are monitoring your own transmissions, just connect your transmitter coax to either coax connector on SM-220 and the antenna coax connects to the remaining coax connector on SM-220. Can be used with any transmitter up to 1500 watts PEP output. If you have the optional BS-8 panadaptor in the SM-220, and wish to monitor the adjacent frequencies on receive, simply connect a phono connector cable from the IF output connector on the TS-950 to the IF input on back of SM-220. The SM -230 monitor has a few additional features and has the BS-8 built in but costs three times as much. The SM-220 is fine, however.

Hello hams,

I have just got an Yaesu FT-2600M 2m tranciever (a very nice radio), but the model has been preset to match with the US repeater bands, the default repeater shift/split segments don't match with the european band plan.

The operating manual don't tell how to switch between US and EU settings. Do anyone here know how?

Very interesting, but what does that have to do with anything but C-64?
Why the other items in the title when they are unrelated?

Thank,

Greetings from Texas!

I am restoring a Kris 23+ tube-type CB radio base station.
It came to me with no tubes installed, and no other info.
I need to know what tubes are used in this set. My radio
is a later model. The earlier model, which is covered in
Sams Photofacts volume 45, is different from the later
model in many ways (the two models don't even have the same
number of tubes in them!). Is there a Sams for the later
model? If so, what volume? At least knowing what all of
the tube types are will be a start.

Thanks and 73,
Dean, K5DH

PS: To the hams who will no doubt be tempted to bitch at
me for posting a CB-related query on the ham radio groups,
I'd like to point out that hams have been a much better
source for this kind of information than CBers. I guess
that's because the majority of hams used to be CBers. -DH

2562. Alinco dr-605tq/antenna questions

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-12 14:13:49 UTC
From: jlcook@clemson.edu
Message-ID: <e3c79b3.0303120613.1267054a@posting.google.com>
Source record: 32544

I am a new ham and have just gotten my first radio, a dual bander Alinco dr-605tq. It is currently connected to a mobile antenna from Radio Shack that is marketed as a scanner that can also transmit on 2m/70cm.
I have some concerns about it not knowing how other radios perform. The main problem is that there is a constant quiet white noise whenever anyone transmits. Can 2m FM sound like FM in by car or am I expecting too much?
I have not tested the SWR going into the R/S antenna. I have been transmitting at high (50 watts). Can that hurt my radio at all/quickly? I tried to check into a net that I normally do, and had extreme difficulty being heard on the repeater 40 miles away even with 50 watts. Have I broken my radio, or is there some form of weather(?) that can affect the range so much. Another person also had trouble yesterday getting in.

I tried to listen to a Uo-14 and could not hear more than a few sconds worth of choppy speach, but I a guy said he heard a few minutes well on his HT the same day/location with a rubber duck.

I am hoping/thinking that this can all me solved by getting a decent antenna, but am not ruling out the rig, or maybe I am just expecting too much.

2563. FS:HT1000 UHF 450-512 WITH 16 CHANNELS HI CAP BATTERY AND VOICE SECURITY MODULE (AVS)

Hello group I have a 16 channel HT1000 radio in uhf 450-512 in excellent condition comes
with high capacity battery, slow charger and a public safety speaker mic
radio has an analog voice inversion board already installed but unprogrammed
part# ntn8313a I will include an additional board they will only work in late model ht's that have an option mate board. Will ship nextday air upon reciept of payment i am asking $350.00 or best offer.

Thanks for your time

Why not put your scope input on ac (very important, so you don't zap
anything), and look and measure the freq of the noise. This way you can
custom build a filter using simple math. Maybe you'll find that the culprit
is not high frequency grunge, but from, let's say, you refrigerator. In that
case a filter would be more effective on the refrigerator instead of the
amp. I try and look at the overall pix instead of having audio tunnel

vision. Hope this helps, not that the other's advice is wrong, just giving you some more grist for thought.
Cordially,
west

2576. Kenwood TM-231A power connector?

Newsgroup: rec.radio.amateur.equipment

Source record: 32408

Hi all,

I recently obtained a TM-231A mobile FM rig. I don't know if it works, but all I need to test it is a power connector. The connector that the rig has is a male plug where the prongs are arranged in a "T" shape. The positive prong is horizontal, the negative vertical. Does anyone know where I can get the female match for this plug? I know that I can buy a kit from HRO, but I don't need the full kit, just the plug.

Thanks!

-Josh, AE6IQ

I come back with my Rabbit (VW Golf...) and back with my kenwood TS-570D too, Hi.

My problem of connecting my TS-570D on the car battery is always in suffering... and my kenwood dealer doens't answer my email...

I tried to connect the RTX on the cigar-lighter but the RTX refuses to switch on. According the RTX designer, this is a problem of +/- poles in the cigar-lighter.
But this device works fine to fire cigarets or to power a small flashlight. So its +/- poles looks correctly built.

Can someone tell me why my RTX refuses to power on in the cigar-lighter and switches on when I use a dry battery >12.5V and a few amps. The car battery is of course powerful enough to power it but not the cigar-lighter... Where is the problem (excepting me that want to use it in mobile...;-))

Thanks for comments

Thierry

Some cigarette lighters are not able to put out the amperage needed by
a mobile rig. If your rig uses more than 5 amps, look to putting in a
direct to battery power cable, with fuses on both lines.

The standard expected with a lighter socket is negative outside,
positive center. Heating elements and many lights are not polarized,
but a radio will be. Some cars may not honor this standard.

Unfortunately, there's still a "disconnect" somewhere. The
tube list on that web site sez 6AQ5 for the audio amp, but
my set has a 9-pin socket, so it can't use a 6AQ5. It has
not been modified by a user, so there must have been more
than two versions. Could be a 6BQ5, 6AW8, 6GW8, etc. I'll
have to find someone who has a radio of the same version as
mine and see what theirs has. :(

The search continues...

73,
Dean K5DH

Hi All,
Firstly, I would like to appologize for the cross post,
for those it anoys, but desperation has set in.

I would like schematics & any other relevant information for a
PCM FM 351 8ch VHF radio, Model 351E Serial 5139
It appears to be approx. mid '80's vintage.

Made by PCM Electronics Pty/Ltd. Melbourne, Australia.
This is now a non-existant company.
In the true spirit of Amateur/Ham Radio I wish to
modify this unit to press into service for Amateur
Radio use as I'm close to AOCP/AOLCP License.
Regs exam pending :)

To see what it looks like goto:
http://www.thebear.dropbear.id.au/Radio/

Please forward any info by email on the WEB Page
if possible thanks.

TIA

The Bear();

Be careful with fusing ground wires as in most(but not all!)
neg earth equip, grounding the rig &/or antenna effectively
removes that fuse = False Protection

I have seen fusing the negative side from many sources, but to protect
you and the radio if there is ever a problem with the battery-to-frame
grounding, and all the return to ground goes through your radio.

2587. Cleaning pots - what to use???

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-12 21:04:26 UTC
From: will7370@yahoo.com
Message-ID: <e88e9b5a.0303121304.6487422b@posting.google.com>
Source record: 32420

Just curious what the professionals these days were recommending to clean dirty pots. Is it still LPS, or is there a better product out there now? I have to laugh when I see my neighbor shooting his pots full of WD-40, or worse yet, rubbing alcohol. It works temporarily, but after a while.....

Any help or suggestions would be appreciated.

Josh,

try www.powerwerx.com What you are looking for is the OEM T-connector.

They have them on their site.

And if it radiates a signal from DC to Daylight? Say a filter is designed
for 1.8 to 30 Mhz. Think it may be a problem?

Well I got my R390A from an old army supply sergant who brought it home
so his wife could listen to shortwave from her home island. When it
stopped working he put it down his basement until yours truely came
along. Got it free and help loading it in the car!

I took it to Rick at Miltronics in Toledo, Ohio. He restored everything,
thats all Rick works on are the R390A's. They are sent to him from all
over the world.

I still remember having to have a Top Secret clearance to operate that
receiver back in the early 60's. I was a young Air Force radio operator
back then. Got it sitting next to my Icom 781 and it works great. I
had forgotten it does not have a built in speaker, so I use my headfones.
Sure brings back a lot of memories from those days.

You trying to figure out what is supposed to be there?

Find the pin for the plate, the pin for the control grid, and the
filament pins, and we'll see what we can come up with.

The majority of hams used to be CBers? What?
Anyway, you put some nice 10M crystals in that thing, a BFO,
and a key, and then you might be getting somewhere.

> I tried to connect the RTX on the cigar-lighter but the RTX refuses to
> switch on. According the RTX designer, this is a problem of +/- poles in the
> cigar-lighter.
> But this device works fine to fire cigarets or to power a small flashlight.
> So its +/- poles looks correctly built.

In addition to a couple of the other answers:
Many cars now-a-days only have power to the "cigar-lighter" (I
can't spell cigarette, either...) in the "RUN" position.

I have NEVER trusted "cigar-lighter" power `solutions`. When you
realise that the POS connection is just a butt-contact -- and what
the cross-section of that contact must look like, microscopically --
and then imagine trying to draw 5/10/15/20 amps through it....
The voltage drop can be LARGE.

I have a manual I can copy and ship for cost to do so. But I will admit, I wasn't too impressed with this unit either, when I had one to play around with for a short period of time.

2602. Re: Audio problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-13 01:28:47 UTC
From: Kevin Smeltz <kevin.smeltz@eds.com>
Message-ID: <j9Rba.9450$a41.8693@news01.bloor.is.net.cable.rogers.com>
Source record: 32432

The problem is not the microphone. The very fact that it is already grounded is what allows the static electricity carried by the person to discharge rapidly, causing the "pop". The only real solution that I know of is to raise the humidity level within the church. This will prevent or at least reduce the buildup of static electricity to begin with. Another possible solution is an antistatic mat near the microphone stand such that a person steps on it and discharges before touching the microphone - but I'm not sure what you'll think of the aesthetics of that.

Regarding the outlets and their boxes not being grounded - I am not a licensed electician, but I would be worried enough to consult one.

Hope this helps at least a little bit.

***At the present price of electricity and the probability that it
will go no place but up, the cost of operating an R-390 with it's
large abundance of tubes will be high. As I recall it also has a
circuit that keeps the oscillator filament on when you shut off the
receiver. This is to retain frequency stability for a quick turn on.
Hot receiver for CW and RTTY, though. Yup, it is a heavy sucker too.

R390A's, atleast, have a built in oven that keeps the crystals,
and VFO warm so they don't drift when ambient temperature changes.

They also have a switch that shuts off the ovens if you don't need
them.

The power consumption with the ovens on is about 220 watts. Off, it is
about 80 watts. Just like a light bulb. Hardly worth getting in
a tizz over.

Before I start, this is no disrespect for other people..
but I just finished reading the other replies & it's so
sad to see so much negativity towards a potentially
rewarding hobby. My suggestion is for those of you that
don't really know the answer, don't answer, it's way too
negative & eventually everyone will be nothing more than
a "Black-Box" operator then it won't be Amateur Radio
IN MY VIEW.

For all of you that say that 'there is no way' I have to ask,
that for an Amateur/Ham, how did you get your license???

Now on a positive note the answer is yes!!
Most PC PSU's have the potential to make a great lightweight
High Current PSU suitablt for Amateur use.

BUT and I do say BUT you must have at least and understanding
of what you are doing.. & for an Amateur that really shouldn't
be a problem...

Without having to chase new parts the power output is largely
dependant on it's inital capacity.

PC PSU's can range in output from as low as 90w to the largest "I"
have seen of around 450W. Now you could probably knock a couple of %
from that and that is your available power.

I would recommend to stay away from ATX type supplies, not because
they cannot be converted, but more because of the 'soft switching'
feature might make it somewhat harder to press into service THOUGH
I MAY BE WRONG on that note.
Besides there are plenty of AT type PSU's to use :)

The "average" 250W PSU you can safely expect around 15amps, whereas
a 350W unit could approach nearly 25amps @ 13v8!!!

SIMPLY described all that is required is to rewind the secondary
with the appropriate wire and alter the regulation circuit to suit.

I have found an great article that describes for the most part on
how to modify a 240W PC PSU to achieve upto about 15A @ 13v8.

With that I must congratulate Amateur DL2YEO for this, as he shows what Amateur Radio is really about, initiative.

Erm ... not exactly, as the rental-car ad has it. Rick did a *great*
job on an all-Collins R-390 (non-A) that he sold me two years ago. It
is at the high end of superb.

And, as my MARS-shack story shows, in 1969 they were UNCLAS and being
retired from use by MARS. Are you sure that you didn't need the TS to
be where the gear was? I've never seen an R-390 or R-390A with any
sort of classification legend on *it*. On the cover over the window
showing the frequency, sure.

I agree.

A properly grounded system by current (ha, ha) electrical code
standards would mean that the grounding pins on each outlet box be
tied in to the building ground at a single point, which typically ties
together at the main junction box, with the actual ground attached
either to a metal rod driven into the soil, or tied to the main metal
water supply piping. This is a safety issue well beyond your
microphone issue. I would suggest bringing in a licensed electrician
to look over the system and its grounding, who is familiar with the
applicable building codes for that building (older buildings do not
have to meet newer codes in many cases until substantial renovations
are done).

As far as your static goes, once the above is done, it will be easy to
get one of the pads sold in computer stores to ground yourself before
touching a keyboard, which ties into the building ground.

Also, your mike wiring does seem a little hacky with that small
diameter wiring.

Happy trails,
Gary (net.yogi.bear)

Hi Murray,

I've been told that a couple of nukes high in the atmosphere and the EMPs will destroy anything
digital. Then only the ones with the tube rigs will be on the air. 'Course we probably won't have
commercial/residential power then either ?

Looks suspiciously like a Philips 828 to me - is it a crystal controlled radio by any chance? Also does it have a label down near the back with information on it - i.e. model, serial, etc? Are there more numbers on the ID plate than what you have already provided?

Matt

The cost of electricity has gone up more than 30% during the past three
months in my area. That may not be significant for a device using
80-watts on stand-by, but when you include all the other electrical
devices in the house it adds up.

Hi,

Some indeed but mine works also in "OFF" position.
But I also learnt that the amps available on the cigar-lighter could
not power a RTX. It seems that it provides about 0.50 to 0.75 A, far
to be enough to power a receptor that requests about 1 A to power on.
So for emission, I forget it as the TS-570D (100W) requests much more
than 10A.
The solution should be to ask my garage mechanic to add some cable of
about 2mm section, protected, etc, to connect the RTX (or a bridge on
the car radio or so). This solution looks fine.
Now i know what to tell them.
NB. Of course I can always use a powerful dry battery.

Hope this helps some of you too.

Hi Matt,
I should really put up a better quality image,
It is crystal controlled with the crystals just behind the front
panel behind the PCM Logo on the left but accessed from the top

The Model & Serial numbers are actually located in the top section
above the PCM Logo on the front panel
these numbers are actually stamped with small but fine detail numbers
There are no other plates on this unit

Ihave now added a retouched pic to the page, It's much brighter
to show the 2 white flecks in the top left section above the PCM Logo
these are the words "Model:" & "Serial No:" numbers are stamped to the right of
each of these as mentioned.

I also stupidly forgot to mention the 3mm red LED also Just to the right of the
PCM Logo

I shall endevor to get some more & better pics up
thanks just the same

Thank you all. Trying a carpet spray (either the specific antistatic stuff or a general fabric softner) seems the best approach. An antistatic mat on the rich-looking red carpet would not go over very well. Unfortunately, the carpet is almost new and replacing it is not an option at this time.

There are many old buildings with "two-wire" power that are grandfathered under existing codes, I believe. If they ever do any *new* wiring work, I assume it would have proper grounds.

My first apprach --- ground the microphone exterior (stand, lecturn) --- was on the theory that the static would be discharged that way and not *through* the microphone. At the moment, it is probably going through the mike element and that is what is making the noise.

Regards,

Bill

The ovens are also for use if you need extreme stability for RTTY operation.
With the ovens on, you can tune to something using 425 Hz shift, come back
a week later and it's still on tune. Without the ovens, it'll be printing
gibberish.

2630. Headphone resistance question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-13 20:09:21 UTC
From: cprstn54zz@att.net
Message-ID: <3e70e56d.24176906@news-server.optonline.net>
Source record: 32362

I am building a passive audio filter kit that requires an 8-ohm headphone. Apparently, this is or was a standard for mono headphones. All my headphones are stereo and start at 50 ohms each side. In parallel they present 25 ohms.

The kit designer says the filter needs to see 8 ohms at the jack to work right, so I have to add 12 ohms in parallel with my headphones to get their resistance down to 8 ohms. This will waste some power, but will work.

In a nutshell, why do headphones span such a large resistance range? The best ones seem to be 600 ohms. Are there any decent 8 ohm headphones to be had at reasonable price?

***I bow to Chuck on the 80 watts. Should have done my homework.
For certain, I thought it would draw more. However, when we
increase to 220 watts for RTTY/CW stability purposes, while
it won't drive the owner into bankruptcy, it will add up if used all
day, every day. I remember drooling over the prospect of owning one
which I eventually did. Now, I would not bring it into the house,
primarily because of the weight factor. How times change. Anyhoo,
to the new owner(s) out thar, have fun and enjoy the receiver. It
has a lot of history, especially in the military and intelligence
communities.

To the best of my knowledge the source should always be a lower
impedeace than the load. So if you have a 8 ohm headphone jack (source)
and your headphones (load) are more than 8 ohms then you should be ok.

Anybody else?

I think that is true in general. So 50 watts headphones will work OK
with an 8 ohm source. Hi-ever, this here thing (the W3NQN passive
filter) (i.e. no power) apparently needs to see no more than 8 ohms
at the jack to do its magic. There is info on it at:
http://www.arkayengravers.com/wb2art/filter.html

I have since learned that "communications headphones" are often 8 ohms
and that their principal "virtue" is a small audio range -- which
tends to filter out noise at the high end.

They appear to be something you wouldn't buy unless you had to.

Use a 8 Ohm to 600 Ohm transformer, then you will not waste power
and can use real good headphones.

For sale: Kenwood Speaker SP-23 like new. Includes the original Kenwood packaging and the connector. It was purchased in October 2001 and used with my TS-2000 for one year. It sells new at $69 to $89 at online stores. I am asking $64 plus postage.

Pictures on my web site at

Just exactly what are you saying is "dead wrong"? You don't
think the power supply I've got sitting in front of me is rated
at 31 Amps?? You don't think it could power a device requiring
13.8v at 20A??? You don't think the OP is probably talking
about an AT supply???? You don't think that computer PSU's in
general do not have 20 Amp capability?????

It happens that using old ATX power supplies to power various
high current 12 VDC Peltier devices is a rather common subject
for discussion on computer "overclocking" forums. All number of
variations, from paralleling two of them to putting different
voltages in series have all been commonly tried with success.
It is not a matter of can it be done, just a matter of having
the PSU(s) and doing it.

And, "computer power supplies" are not limited to those that are
commonly seen in PC's.

Source record: 32378

I have a Yaesu VX-5R HT with a loose SMA antenna connector. When you remove the antenna, you can see a slotted ring at the base of the SMA connector. I need a tool to tighten this ring.

I've tried using needle nose pliers and snap ring pliers; both failed.

I have a spanner wrench for BNC connectors that measures 13 MM across the prongs. Not sure where I got this spanner.....

I need a spanner that measures 8 MM across or the correct tool for this SMA connector.

Where can I get the SMA spanner or tool?

Does anyone have another method of tightening these connectors?

Thanks --- 73's

A camera repair shop may have a good tool to do this, there are
similar fasteners in some cameras. They have a tool which works as an
adjustable spanner, with varying tips.

Worth a shot, anyway.

Happy trails,

First of all, it's not 8 ohms resistance, it's 8 ohms IMPEDANCE. Since you're looking at it as a resistance, you're bogged down in thinking about parallel resistors. A simple and inexpensive way to match audio impedances is to use a small filament transformer (or two), keeping in mind that the impedance is transformed by the square of the turns ratio. In other words, a 120 / 12.6 V transformer would have a turns ratio of approximately 9.5:1 and your 8 ohm impedance would be transformed to 722 ohms, close enough for high impedance headphones.

I suspect that you are measuring your headphones with a VOM and reading the 50 ohm values. The impedance would be much higher than that. Try the filament transformer - it will probably work just fine for you.

My headphones are Sony MDR-V600's. I measured 50 ohms each side with
a DVM. Sony's spec for the impedance is 45 ohms:
http://www.sel.sony.com/SEL/consumer/ss5/home/accessories/studiomonitorheadphones/mdr-v600_specs.shtml

I assume [maybe incorrectly?] this is each side. Shorted together,
they would present 22.5 ohms. I would need a 1:3 transformer; I
haven't been able to find one.

OTOH, a 12 ohm resistor in parallel would also appear to do the job
-- albeit at the expense of 2/3 of the output audio power .

Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,alt.firefighters,rec.radio.scanner

I have an FTH-2070. It works just fine in the ham bands, both VHF and UHF. However it is an OLD radio design and only has 32 channels. The programming software is also very old, and will only run on older technology PC's (486 or less) in true DOS mode. The radio is physically large, pretty rugged. I would not consider it seriously unless you truly need an FCC certificated dual band radio. For the price (of a new one) you can get two newer radios, one on each band, with much more capability.

I have not experienced intermod problems with mine, and I do live, and use it, in a tough environment.

So in summary, if the price is right, and you really need a certificated dual band, go for it. Otherwise, buy newer and better. There have been rumors that Vertex might introduce a dual band radio based on the VX-900, which would be fantastic. But those are unsubstantiated rumors, and I've seen no indication that it is true.

For a transformation ratio of 1:3, you'd need a turns ratio of 1: 1.7 . The small filament transformers are pretty easy to modify. Remove the shell around the laminations, disassemble the laminations and the coil. The filament winding should be on the outside. Count the turns as you remove the low voltage winding (there won't be many) and you'll be able to calculate the turns in the primary from the voltage ratio. Wind a new secondary with the desired number of turns. You may have to use much smaller gauge wire to fit the space available.

That's correct. Note that is a 1:3 impedance ratio, not turns
ratio.

>OTOH, a 12 ohm resistor in parallel would also appear to do the job
>-- albeit at the expense of 2/3 of the output audio power .

The 12 Ohm resistor has one other advantage too, in that it will
swamp any impedance variations that the headphones may have, and
thus present a more uniform impedance to the filter. The filter
of course requires the correct termination or it will not
perform as designed, hence using a resistor as opposed to a
tranformer will probably improve the filter response. Of course
the downside is that if the headphones are not sensitive enough,
you may not have enough power to get a decent volume.

Find a 5 watt 12 Ohm resistor and give it a try.

Hi,

I am searching an excellent (light but robust) microphone connected to a headphone (mini or normal jack).

I own a splendid Panasonic headphone RP-HT51 without mic that I can fold to reduce its place when I place it in my alu case and I am searching a similar one including a mini mic like some secret agent or secretaries use (one cm long and still smaller in tickness), if exists of course, Hi !

If I can explain what I mean (sorry for my English) in fact I am searching a headphone including 2 foams for the ears (not the big one englobing the ear, too hot, and not coming with only one ear, too much QRM entering the other ear).
I am looking for a light model, small but robust (should sirvive a few years), if possible.
Something like that, and of course suited for hamradio activities (HF) :
http://www.tigerdirect.com/images/SKUimages/medium/B500-2076.jpg

I know only one model to Shure. It must be others, isn't it ?

Hello group I have a 16 channel HT1000 radio in uhf 450-512 in excellent condition comes
with high capacity battery, slow charger and a public safety speaker mic
radio has an analog voice inversion board already installed but unprogrammed
part# ntn8313a I will include an additional board they will only work in
late model ht's that have an option mate board.
I will also throw in a rib box with programming cable will e-mail RSS if needed.
I Will ship nextday air upon
reciept of payment i am asking $350.00 or best offer.
I would consider a trade for a GE MRK III portable in uhf.

Thanks for your time

I use a set sold in stores for use with home computers. Works great on my HT and on my HF radio. At under $10 U.S. they last a few years, then I replace them. I get many compliments on my Audio.

If the radio is not an Icom, you need to add a power supply, but that is easy. Here is one I added to my home HF radio with out modifying the face. THE PIN NUMBERS are unique to this brand of radio (Kachina) be sure to use the correct pin numbers for you radio.

2661. Mutek xverter. Never more....

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-14 18:42:07 UTC
From: iw0gxy@yahoo.it
Message-ID: <d99a1af3.0303141042.5e911d49@posting.google.com>
Source record: 32395

I bought a used xverter, the mutek tvvf144a a 28->144 Mhz but unfortunately it wont work. I took a look inside to see if any unplagged cable or what and i fond an unplagged wire and a couple of burned components. I could not see the color code of those resistances so i asked to the Mutek company to help me with the schematic. I sent them 4 emails, one of which with the digital picture of the area with the burned components and the unplugged wire but nothing. After 15 days I think the wont reply.
I decided to buy another good xverter but this time new and from an Italian factory. They were so kind to send me all the informations I asked and today i ordered it. 350i¿½ for a beautiful, sensitive and professional made xverter.
Never more Mutek cause they don't care their customer and their products.
Never more

I did but the main problem is to find a headset which microphone connexion
is compatible with e.g. a kenwood RTX (the special mic jack with 8 male
needles). 99% of headsets I checked (see my URL) come with a 3.5mm 2x plug
and some with a Shure jack (normal jack) or Sennheisen (mini jack). None
sale a headset with entry to the RTX headphone and another one to the mic...
And I cannot really made it myself, or that must be very easy ;-)

I use Heil headphones and mikes and they came with the correct
connectors for a Kenwood TS-450SAT. That's an 8-pin mike jack.
It has one connector for the mike and a 1/4 inch phone plug for
the headphones.

OK I have probably found it. I checked also on eham.net.
The heilsound BM-10 seems to meet my requirements or nearly (about $100).

Tks

A definite weakness in this particular HT design.

>I need a spanner that measures 8 MM across or the correct tool for
>this SMA connector.
>
>Where can I get the SMA spanner or tool?
>
>Does anyone have another method of tightening these connectors?

I just recently used a trick I'd read about on the Net (I forget
where, alas, so I can't credit the original author).

I went down to Orchard Supply, and bought one of their "multi-tip"
utility screwdrivers. This has a plastic handle, a removable shaft
which has 1/4" and 5/8" nut drivers on either end, and a couple of
double-ended screwdriver bits with hex shafts which snap-fit into the
nut-drivers. In effect it's six different tools in one.

I unsnapped the shaft, and then used a Dremel hand tool equipped with
a small grinding/cutting disk to cut down the end of the 1/4"
nut-driver. I first made a set of four shallow cuts, along the axis
of the nut-driver - two on each side, leaving a thin flange of metal
about a millimeter wide between the two cuts in a pair. These flanges
are just wide enough to fit into the slots in the SMA connector ring.
Side view:

```
---- ----
| | | | |
| +-+-+ |
| |
| |
| |
```

I then ground out the metal around most of the end of the nut-driver,
going the "long way" between the cuts I'd made. This left me with a
still-usable nut driver, with a couple of small flanges sticking up on
opposite sides. Side view:

```
|
-----+-----
| |
| |
```

| |
| |
| |

The 1/4" nut driver fits very nicely over the SMA jack, and the
flanges are properly spaced to fit into the slots in the jack-retaining
ring. A gentle twist, and the ring is nice and tight. Snap the
screwdriver tips back into the nut-drivers, slide the nut-driver shaft
into the plastic handle (with the new "SMA wrench" end going into the
handle base, protecting the flanges), and it's now a 7-function tool
costing $4.00 plus maybe 10 minutes of grinding.

I've seen people suggest replacing the slotted ring with a standard
hex nut, and then use a "thin wall" nut driver to tighten it down.
Seems like a good idea, but I was unable to locate a thin-wall driver
at Orchard - it's probably something that one would need to go to a
specialty store to find. Pulse Research Labs has some specialized
wrenches designed for tightening SMA cables to their jacks which
might work but I'm not sure I want to spend $12 to find out.

De-oxit is fine for cleaning potentiometers and I guess lubricates it to some extent (maybe with mineral oil?), though I have another question:

What type of grease do the manufacturers use when they assemble the pot? And where can I get some? I know that one can obtain Nye "Damping Grease" from "Micro-Tools" for smoothing the axle, but what is used on the carbon contacts to prevent them from wearing down?

-Thanks!
Mike Sledz

You can do all that but if you don't have time then try RS they may have
a transformer made to work.

I still don't think you have to worry about impedence matching as long
as the load is bigger than the source....we're talking audio not RF.
I remember using a D-104 which is very high impedence into a low
impdence mike input on a modern day radio, they sound auful. Match it
up it sounds great. Hi Z into a Low Z = bad. Low Z into Hi Z = good.

I have a pair of Sony MDR-7506 headphones, 63 ohm z, I use them on my
radios which have a 8 ohm z output, they work great. I also have
another pair of headphones with a 600 ohm z and use them with no loss of
volume with a Icom 775 they work great.

I don't mean to be contrary here but I'm just expressing my own
experiance.

If you go to www.radioshack.com then you can use their search engine
to find documentation for all sorts of current and discontinued
products.

Use variations on the model number, such as MTA-20, MTA20, and also
the Radio Shack stock number, etc as it has them listed under
variations.

Happy trails,

2673. Re: Kenwood Sky Command

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-15 01:03:08 UTC
From: dplatt@radagast.org
Message-ID: <v74uuc8djg2s93@corp.supernews.com>
Source record: 32305

Back on 2/4/2003, wx3g@earthlink.net asked:

>Is it now legal to operate an remote controlled high frequency amateur radio
>station via the Kenwood Sky Command System (KSS) on the 144.mhz & 440.mhz
>bands ?

According to an article I just ran across in CQ last night, the answer
is clearly "No, not in the U.S."

Back in July 2000, the FCC ruled on a petition from Kenwood which
requested that the use of Sky Command be allowed in the United States.
Specifically, Kenwood asked for a declaration that Sky Command
complied with Part 97, or (failing that) asked for a waiver of the
Part 97 rules so that Sky Command could be used legally in the United
States.

The FCC ruled against Kenwood on both questions.

The FCC found that Sky Command does not comply with Section 97.201b,
which restricts the frequencies on which an auxiliary station (one
maintaining a control link of an amateur station) may transmit.
Auxiliary stations are allowed to transmit on a few segments of the
220 and 430 MHz amateur bands, and on the 1.2 GHz (and above) bands.

Sky Command uses the 440 MHz band to transmit control/telecommand, and
outbound voice from the HT to the controlled base, and uses the
2-meter VHF band for the return path (inbound voice).

Kenwood argued that because the 2-meter path is voice-only and is not
for telecommand, it should not be considered as part of an auxiliary
base operation. The FCC disagreed, calling this a "tortured
interpretation" of the rules, and declared that Sky Command in its
current form _is_ an auxiliary base and does not operate in a way
which complies with the rules.

The FCC then discussed Kenwood's request for a waiver of the rules,
and ruled against Kenwood on several grounds: risk of interference
with other 2-meter band uses, lack of evidence that availability of
Sky Command would really serve the public interest, concern about
providing a rule waiver which would favor one specific manufacturer,
and the availability of reasonable alternatives which comply with the
rules but which Kenwood has chosen voluntarily not to implement or to
not import into the U.S.

The president of Kenwood USA has apparently filed another petition,
in effect asking that the auxiliary-station rules be overturned as
poorly written and unduely restrictive.

So, at the moment, it appears that the use of Sky Command to control HF receivers in the U.S. would put the amateur using the system at risk of a slapping from the FCC (warning letters, fines, license suspension, the usual stuff).

According to the article in CQ, the magazine (and I believe QST as well) has chosen not to accept Kenwood ads which promote the Sky Command feature of their products.

I've had good luck with many RS manuals on there, although I seem to
do better with the stock number as a search term.

The website/warehouse seems to have different stock than the retail
stores, and the left hand/right hand thing is in effect.

|
|OK I have probably found it. I checked also on eham.net.
|The heilsound BM-10 seems to meet my requirements or nearly (about $100).

If your experience is like mine, you will hate the Heil headphones.
They sound awful. I bought a set and used them five minutes and took
them back.

Before those that spent lots of money for Heil and thus think they are
great start screaming, let me state that I'm not alone in my
condemnation. On4UN in his book, "Low-Band DXing" says the same
thing.

If you really want to hear signals cleanly and without fatigue then
stick with "hi-fi" phones and shape the audio electronically to
"communications quality." I don't know of any headset/microphone
combination that meets this requirement.

For DXing, I use a David Clark headset/microphone. These are widely
used in American aviation, both commercial and military. They are too
heavy, grip the head too tightly and are not as clean sounding as my
Koss phones that I use with a desk mike. But they are a decent,
although very expensive, compromise.

pull
> in anything.

I agree although it is a kick to do some BCB dxing at night with the
internal antenna. I can be amazingly good.

> Antenna supplied was somewhat deaf on 220 MHz -- so I bought a Comet
> HT-224 -- works a lot better.

My stock antenna seems to work OK on 220. I am unfamiliar with the HT-224

> Otherwise it works well.
> I got the programming cable -- saves a lot of frustration in programming.

I agree. There is a free program from Kenwood and a Shareware program for
$35.00 with a few more bells and whistles. Do a google search on the TH-F6
and it will pop up.

To answer your other question, yes, it is worth buying. Unfortunately it is
a little small for my hands (and eyes). Other than that it is a great
little radio. Rx works well out of band also.

However, we aren't just talking about either the input or the
output of a broadband amplifier (where what you are saying would
be exactly true). The OP said,

"I am building a passive audio filter kit that requires
an 8-ohm headphone."

Filters, or at least some of them, must be terminated in the
appropriate impedance to provide the filter effect that they are
designed for. Hence if it requires an 8 Ohm termination and
instead has 600 Ohms, the filter might not do the job it was
designed to do. Even being a few percent off, never mind several
magnitudes, could be a problem. So it might work well with 8 Ohms,
and not work well at all with even 12, never mind 22.

Ohoo...!
Ok I will check if a refund or money back is accepted prior to buy such
product from the german dealer.
Thanks for advice.
And theoretically I am full agree with you. Two separate, high quality
modules (mic + headphone) should be better than an integrated headset. To
follow.

Hi Thierry,

if it is not too late, try also the combination recommended by John ON4UN. Radio Shack PRO 50-MX. Have had replace a dynamic capsule with Heil HC-5 and it works splendid! The PRO 50-X costs 40-50 us$ and Heil HC-5 30-40 US$ or Euro. The hams in our club were so delighted with the headset that we bought 12 of them. Looking closely, the headphones are KOSS and the mic as well. Wes is right, playing with the equalizers (aka TS-2000 and Yaesu FT1000MP) gives excellent results. For sake of easiness in contests I would chose Kenwood HS-5 and add the boom mic (maybe from computer sets). See Thierry, you might role your own!

Best regards,

Nermin S58DX

Does anyone sell a small box with, say, 4 pairs of red and black
banana jacks?

I am thinking of standardizing my under-10-amp (12 volt) power
connectors using banana plugs. It would be nice if there is already a
box that the devices could plug into -- instead of making my own
(which I am prepared to do) or using the piggy-back plugs.

Also consider going with the Anderson PowerPole, which is being used
by many emergency radio groups as a standard 12V power connector.

The Rigrunner is a commercial box like what you describe, using the
PowerPoles.

Yes, the D5 is great stuff.

Just a little is all you need.

The D5 spray cans are shipped as hazmat on ups so you will pay a few dollars
extra if
you order it from mcmelectronics.com

the D5P is a pump spray, no propellants so no hazmat fee.

Cailube is good for pots, common in recording industry.

http://www.caig.com/ is manufacturer link.

The Deoxit d5 or d5p is just fine, 5 % of original formula,
it also is in 100 % strength.

http://www.caig.com/ learn more about this stuff at this link.

One day left. I'm auctioning off on eBay a whole bunch of cables, connectors, adapters, switchbox, networking cables, and more

If you have an older Macintosh or even if you don't, this is an amazing bundle of goodies.

Here's a list of most of what is included in the picture (see eBay link)...I will also include at least a half-dozen more surprises (cables, adapters, etc.) in with this package that are NOT pictured here. ...

1 - Eastern Data 4-Port DIN-8 SwitchBox
2 - Misc SCSI Termintors
3 - ADB Y-Connector
4 - DIN-8 to RS-232 (male) cable (eg mac modem port to modem)
5 - ADB Extension Cord (male to female)
6 - TWO DIN-8 to DIN-8 cables (male to male)
7 - Special Mac Microphone (the one with the long miniature plug)
8 - FIVE Farallon PhoneNet Networking Adapters (3 DIN-8, 2 DB-9)
9 - Long telephone cable
10 - PLUS a surprise package of additional cables and adapters NOT pictured.

If interested, here's the link...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3405754492

THANKS!

2701. FA: LAST DAY - Audio Power Filament Transformers

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-15 18:19:57 UTC

Hi...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3012370140

I"m selling a box full of misc transformers..Audio, Power, Filament, etc
---
This box of transformers will include, at least, the following...

Audio Driver Transformers (Prim Imp 1K CT, Sec Imp 500 ohm CT)
Audio Driver Transformers (Prim Imp 1K CT, Sec Imp 500 ohm CT)
Audio Driver Transformers (Prim Imp 1K CT, Sec Imp 500 ohm CT)
Audio Driver Transformers (Prim Imp 1K CT, Sec Imp 500 ohm CT)
Power Supply Transformer (Prim 117VAC, Sec 12.6 VCT @ 100mA)
Power Transformer (Prim 117VAC, Two Sec at 12.6 V @ 0.178A each)
Power Supply Transformer (Prim 117VAC, Sec 12.6 VCT @ 100mA)
Power Transformer (Prim 120VAC, 6.3 V 1.2 A)
Power Transformer (Prim 120VAC, 6.3 V 1.2 A)
Power Transformer (Prim 120VAC, 6.3 V 1.2 A)
Transformer Stancor A-3857 (4 ohms one side, 25000 ohms CT other side)
Mouser Power Transformer (Prim 120VAC, 12.6 VCT 100mA)
Transformer (Prim 120VAC, Sec 26.5 V CT @0.6A)
Filament Transformer (Primary 115 VAC, Sec 25.2 V CT 2.0 A

If interested, here's the link to the eBay page (with a picture of the
box full of transformers)...

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3012370140

Thanks and good luck...

Ken

<< Filters, or at least some of them, must be terminated in the appropriate impedance to provide the filter effect that they are designed for. Hence if it requires an 8 Ohm termination and instead has 600 Ohms, the filter might not do the job it was designed to do. Even being a few percent off, never mind several magnitudes, could be a problem. So it might work well with 8 Ohms, and not work well at all with even 12, never mind 22. >>

Floyd-

While you're quite right, the typical earphone/speaker/transducer does not have a perfectly flat impedance curve! For best response, how about terminating with a low value resistor in parallel with the headphone?

A value could be chosen so that the parallel combination with the nominal headphone impedance, would produce 8 Ohms. For a 100 to 1000 Ohm headphone, I think an 8.2 Ohm resistor would be close enough.

You may be able to compensate for the lower level by turning up the volume a little bit.

Please help, I take care of my disabled mother full-time and need a way to go to the store, walk/bike, yard work and still keep in contact (she can only be left alone about 10 mins. at most unless she can get ahold of me). Cell Phone is out due to costs and other reasons. Stores are within 1 mile. Best I can come up with is to buy a rechargeable 2-way FRS radio and the one that seems to get pretty good reviews is the Motorola Talkabout T5420-nicad2. It's about $70 a pair or possibly less if I shop around. Is anyone aware of a better pair of rechargeable FRS 2-way radios for around this price? I gotta get out of this house, I'm going nuts! The radio would give me enough freedom to do a few things locally and she can still call me and I can be home in 5 mins.

Thanks, Jeff

That is exactly what was being suggested.

>A value could be chosen so that the parallel combination with the nominal
>headphone impedance, would produce 8 Ohms. For a 100 to 1000 Ohm headphone, I
>think an 8.2 Ohm resistor would be close enough.

Except he has a set of headphones that is 22.5 Ohms, not 100 to 1000.
That is why he was suggesting 12 Ohms, and that is why I was discussing
the effects of using that value.

>You may be able to compensate for the lower level by turning up the volume a
>little bit.

The level probably won't actually be any lower. The output
impedance of the amplifier is probably significantly less than 8
ohms, hence the power absorbed by the load will be entirely
dependant upon the load. Placing the headphones across the
output at some given volume setting will allow a certain amount
of power to be delivered to the headset, and that amount will
not be changed by adding the 12 Ohm resistor. The output
amplifier will continue to supply pretty much the same amount of
power to the headphones plus it will also supply power to the
resistor; hence without changing the volume setting the total
power supplied will go up but the loudness from the headphones
will probably not change at all.

Chuck,

I have owned a 530s for many years. I have LENT it out, but wont part with it. It is a excellent radio for its vintage. Many folks think it is similar to the famous 520, but it is a totally different radio.

After warmup (30 min) it is very stable. Not a modern 1 ppm of course but certainly decent. It is a first class rig on CW and can be adjusted on the carrier drop out FROM THE FRONT PANNEL. Very handy. Can get near break in action if you set it close.

The TX and RX audio is supurb. And it is built like a battleship. Very good all around.

Tubes are still available, and will be for a long long time.

I also have the service manual if you ever need info Chuck.

I would go as much as 400 for one in great shape. But then I love the little rig.

$400 is a little high for a 530. You can get a TS-830 for less than that if you shop around carefully. A matched pair of tubes is just $40 anyway. I'd offer him no more than $300, but that's just me. However, if you can spend just a little more, you should be able to get a TS-850 for about $700-800 and that is one of the best rigs Kenwood has ever made (and it has no tubes). No contest.

Yes. I had heard about these. Look good. Ordered up a few. >>

Ken & Gary-

I've tried Banana plugs, but they are not as convenient to wire-up as I would like. I saw the Anderson PowerPole connectors for sale at the Orlando Hamfest, by West Mountain Radio (www.westmountainradio.com). Now I wish I had bought some. Are they available from other sources as well?

On a side note, I recently bought the Radio Shack 25 Amp Switching Power Supply, which is on sale for $59. Its Banana/binding posts are only rated for 10 Amps!

I bought mine from:
http://www.powerwerx.com/

He is a little more expensive than the other source I found, but had a
better selection. The other source was:
http://www.cablexperts.com/cfdocs/cat.cfm?ItemGroup=9&itmsub=0&bskt=0&USA_ship=1&c=0

I also ordered the crimping tool and the insertion tool.

As far as the Radio Shack power supply is concerned, Yes, it would
appear that if you use the terminals as banana jacks, you are limited
to 10 amps. However, they are binding posts with beefy conductors.
Looks like you can put a 10 ga. wire thru them.

2732. QRM on 49.830 MHz

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-16 21:32:01 UTC
From: cprstn54zz@att.net
Message-ID: <3e74eb71.287862968@news-server.optonline.net>
Source record: 32214

I just picked up on clearance sale a pair of Radio Shack 21-406 VOX walkie-talkies ($95 marked down to $4) for use when bicycling.

They operate on 49.830 MHz FM. A search of the web indicates that this frequency is allocated to this type of use (including motorcycle helmet intercoms) and baby monitors.

I get almost constant QRM that keeps RX open. The squelch is not adjustable in any obvious way. It is a whine with a wah-wah superimposed. I also hear it on my HT's on this frequency. I get it within 5 miles of my shack (as far as I'v gone). It disappears from time to time -- like when I am in a depression.

What else uses this frequency -- or a nearby one -- that could be causing the problem?

The old-fashioned 48/49 Mcs. cordless phones can use this freq., too.
The "...whine with a wah-wah..." could be the "Are you there?"
operation of the base when the handset is not in it's cradle.

> I get it within 5 miles of my shack (as far as I'v gone).

But, that seems a bit `too` strong for a cordless base.

HOMEBREW 2 METER MOSFET PREAMP 13DB GAIN-12VDC---- A homebrew 2 meter preamp uses a dual-gate diode protected Mosfet transistor (RCA 40673). Requires no neutralization and could be used with any 2 meter receiver. Circuit design was taken from a 1971 QST and the issue will be included. An additional 2 spare Mosfet transistors will be included. 12vdc capacitor input. An excellent 2 meter preamplifier built with quality components. Will sell for $5.00
VINTAGE ADJUSTABLE 12VDC 3AMP POWER SUPPLY-EXCELLENT---- Vintage Regulated 12VDC Adjustable 3 Amp Power Supply originally made by Executone under Patents of Western Electric and AT&T. Power supply was mofified and fully tested and operational. All functions work fine. Uses Western Electric 425H 1273 Diodes and I will include new spares with the unit. Has a rotary switch which allows the voltage to to be set in discreet steps of 8.2VDC, 9.4VDC, 10.0VDC, 11.0VDC, and 12VDC. Unit is fused for 15 amps at 32 volts, and has a red lamp power "on" indicator with an On/Off Switch. All 5 output settings have been fully tested. . The unit measures 8" long by 3 5/8" wide by 3 1/2" high. It weighs 4 3/4 pounds. Fine power supply for any low DC Voltage applications. Will also sell this unit for $5.00. Pics available if anyone is interested.
Thanks, Don WA1TVH dpelrine@c4.net

>
> TIA

All the kenwood hybrid rigs are good radios. Actually almost all older
kenwoods are good radios...Many of the new ones too...The 530 is good.
It's one of the last of the hybrid models, "530SP was the last I
think" and slightly more modern than say the 520 or 820 which were the
earlier series. The 830 was sold at about the same time the 530's
were, and they look very similar. The 830 came out first, which was
the top of the line radio, and then they introduced the 530 as a
"budget version" and a replacement for the earlier TS-520. A 530 is
about the same as an 830 except a few less receiver goodies like VBT,
and the provision for dual IF filters like the 830 does. The 830 was
the best of the hydrid kenwoods as far as receivers. But for average
use, a 530 is just about as good if you can live without the VBT, etc.
They are also fairly easy to work on. If the rig is in good shape, and
works well, I don't think you would go wrong with it. Price? I think
$350 average about right. Maybe $300 for one in average shape. Maybe
$375-$400 for a near mint one. The 830's probably run 50-75 bucks more
on average. Say 350-450??? I paid $500 for my 830 about 3-4 years
ago. Prices are down a bit since then. Another good thing about the
530 or the 830, or the 120 or 130 for that matter...They all can use
the vfo-230 or dfc-230 digital VFO's. No drift, and a few memories.
The internal l/c vfo's in the radios will drift a bit if the temp
changes. Electrically, they are stable, but not thermally. The VFO-230
does not drift at all, even from a cold start. Or at least not enough
that you would ever notice... I bought one for my 830. Money well
spent, and the demand for those VFO's are high in case you decide to
sell and upgrade to a newer radio later.
All those older kenwoods have good audio quality on fone. Both
transmit and receive. Not too picky about mikes either. Almost
anything will work on one from low Z to hi Z. I use a low Z audio
technica dynamic. My 830 is my best CW radio out of all I have. By a
good margin too...I like the VBT "variable bandwidth tuning". MK

How do you manage the PTT feature on these kind of headsets ?
Do you have to manually switch from RX to TX on your RTX front panel or is there a solution to manage it automatically depending the intensity of voice, or so ?
None of the Heil Sound, including the BM-10 HC-5 seems able to manage the PTT...

From: Dave Schmidt <n9nlu@NO_SPAM_charter.net>
Message-ID: <v7c3l8spg2uu97@corp.supernews.com>
Source record: 32237

WANTED...

I'm looking for 2 more EMPTY (no electronics needed) rack/cabnets from the Motorola Centracom series dispatch console. I also need the doors and the desktop brackets to complete my ham station. I have 1 section, just need a few more to fit all the goodies I have.

I'm looking for an Andrew L6PNF (N female) connector for LDF6-50A Heliax (1-1/4)

I need a couple of Andrew L5PNF (N female) connectors for LDF5-50A Heliax (7/8)

I'm looking for a UHF folded dipole array ... 4 bay - 8 bay whatever ...anything better than that Comet GP3 I'm using for a UHF repeater antenna. A DB420 or similar would be nice. Dosent have to be perfect, dings dents, maybe a little corosion is ok.

I'm looking for a commercial built antenna for the VHF Low band area, preferable something with a little more gain than a vertically mounted dipole or a 1/4 wave ground plane. My specific freq is 52.870T/51.170R.

Contact me at...

E-mail ... n9nlu_REMOVE_THIS_@charter.net *** delete the _REMOVE_THIS_ when responding.
Phone: TOLL FREE!!! 877-573-2191 (voice mail)

Does anyone have info on programming the RELM SLU25 for 70CM amateur use?

This is an inexpensive 25 watt FM UHF radio made by RELM (Regency) for commercial use on 450 to 482 MHz.

They use a 9346 EEPROM for memory storage. Any info would be appreciated.

For myself I would want good receve audio volume with quality so I can
understand the person I'm talking too. I would also want it to be
simple to operate, no or the least bit of menu selections. I would also
want the recever to hear good and would want the unit to have
rechargable batteries with a drop in charger. Other than that I cant
think of anymore, unless someone else has some additional advice.

Thanks
dj

Got a catalog that listed this radio remote control which
is clearly labeled "433 MHz", which is in a ham band.
I'm not sure if we are secondary or primary users of
that band segment. But it looks possible that we may
get interference from these things

You confuse the -5v and -12v with the +12v line.

Every standard PC supply has the ability to supply +12v to at least
one hard disk, which often requires more than 2amps all by itself.
All of the PC supplies I've looked at can supply many more than 2amp
at +12v.

You are. The 'soft switch' to turn on the power supply is simply to
ground the correct lead on the output MB connector. (Usually it is
the lone green wire, but I sure wouldn't be on it if I had anything
to lose.) Simply connect it to ground and the supply turns on.
Means you can use a nice remote power switch without running AC
lines all over the chassis. :)

Robert Casey <wa2ise@ix.netcom.com> wrote:

>Got a catalog that listed this radio remote control which
>is clearly labeled "433 MHz", which is in a ham band.

Not a new thing. There are quite a few Part 15 devices using this portion of the band - remote-reading thermometers, garage door openers, etc.

>I'm not sure if we are secondary or primary users of
>that band segment.

Government users are primary in that band.

Amateurs are secondary to the government uses.

Part 15 non-licensed (but certificated) devices take lowest priority... they "must not cause harmful interference" to any licensed user of the band, and "must accept any interference" from licensed users _and_ other Part 15 non-licensed users.

> But it looks possible that we may
>get interference from these things

I'd guess that these particular devices are certificated as "periodic radiators" - they transmit occasionally rather than continually, and thus the FCC considers their potential for causing interference to be small.

However, I don't think I'd operate a repeater-to-repeater link on one of the frequencies authorized for these Part 15 devices.

Hmmm... the ARRL's discussion on Part 15 devices states:

15.231(e) authorizes many types of periodic emitters. Typical examples include remote-reading thermometers and other devices. The rules, as defined in 15.35, allow the manufacturer to determine the average power in a 100 millisecond time period. The device further may not transmit for more 3.33% of the time, with a minimum "silent" period of 10 seconds between transmissions.

Periodic radiators are actually fairly common around 433.92 MHz, a frequency used for Industrial, Scientific and Medical use or for various remote-control operations in other parts of the world. The RF modules designed and sold for those uses are very usable under Part 15 rules. 433.92 MHz is, in most areas, used for various control link functions; it is not likely that harmful interference from this

"legal" signal will occur. In general, periodic radiators do not
cause significant harmful interference.

So, there you have it!

I would give a lot of thought to ease of operations for the mother.
Some are easier than others, and some have a "lockout" so the channel
or code cannot be changed accidentally.

There is no requirement for the two units to be identical.

Two sets of loose rechargables for each is another option to consider.

Happy trails,

This is the last of a few Tek 49x-series analyzers I've gone through and repaired/calibrated. It has a very fresh CRT, a spot-on calibration job (at least as far as I can tell without NIST-certified standards), and a new coat of paint on the cabinet, thanks to the OEM-quality Tek Blue paint formulated by Stan Griffiths W7NI.

Parenthetically, this was the first time I'd used Stan's paint on anything, and I highly recommend it to any Tek scope owners who want to clean up their gear. I was impressed with the color match and finish quality; the photos in the auction don't really do it justice. Drop Stan a line at w7ni (at) easystreet.com if interested.

Operating/service manuals and the 18-40 GHz waveguide mixers are included.

2775. How To Measure a CTCSS Tone

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-18 04:23:29 UTC
From: Dick <rhughes33@cableone.net>
Message-ID: <5f7d7v8ag05lnlbai2qcqkcrjll63234mh@4ax.com>
Source record: 32257

I have an old Icom IC-28H that seems to have a tone problem. I can access one repeater with a 100hz tone, but not another with a 162.2hz tone. It is not a matter of signal strength. There must be something off in the tone generator. My question is, how would you measure a PL tone in a transceiver? I don't have a service manual for the IC-28H.

2780. KNWD TS-570D's KEYER?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-18 06:22:32 UTC
From: electron78@aol.com
Message-ID: <20030318012232.21011.00000095@mb-bj.aol.com>
Source record: 32262

Hi,

Is anyone familiar with the keyer on the Kenwood TS-570D? I am totaly unfamiliar with the features on newer radios (my current rig is a Heath HW-8), but I would like to buy a rig with an internal memory keyer that will send CQ indefinetly (preferably muted on my end), then wait a few seconds for a response, and then send CQ again (until I interupt this cycle when I obtain a response back to my CQ). Does this radio have that feature in its keyer?

Thanks!

-Mike

I've had my F6 since Nov. 2001 and like it. It's small like others
say, but I'm happy with the performance. Get an aftermarket antenna,
the stock as others posted is weak on 220 performance. I wish Kenwood
put charging contacts on the battery and offered an external rapid
charger.

Source record: 32266

One way to do it is to monitor the output of another receiver. You'll need a frequency counter, maybe one with a "period" function, and/or an oscilloscope. The best place to connect this equipment to is the discriminator metering point (if there is one) on the receiver. Most receivers have an audio filter in them to reduce the level of PL tones going to the loudspeaker, so you may not get enough signal at the speaker terminals to measure anything. You can try it there, however.

You might want to use a clip lead or some other device to key your IC28 without having the microphone attached, otherwise you'll end up picking up room noise which will make tone detection very difficult.

The frequency counter set to a 1 second gate time will give you a resolution of 1 Hz, so you chould see 161, 162, or 163 Hz for your 162.2 tone. The period function, if you have one, will give you the reciprocal in microseconds, which will be much faster and more accurate. So for 162.2 Hz you'd see 0.006165 uS. Similarly you can do a measurement with an oscilloscope if you can get enough clean signal to view.

You can also check the PL tone with expensive equipment like a station monitor, which can measure RF frequency, PL tone, deviation, power, etc., but such things are usually only found at two-way radio shops.

And you could also try another PL-capable receiver, set to a known frequency, to verify that your IC28 is working properly.

Hope these help.
Bob M.

From: Jim Wagner <nospam@fromanywhere.net>
Message-ID: <3E771AD8.6020404@fromanywhere.net>
Source record: 32268

Actually I don't use the Heil headset any longer. I mounted the
boom mike from it on a Koss Pro-4AA headset. The Koss has a
headphone mounting stud on the left earpiece compatible with
the Heil mike. I ran the mike wire down the inside of the headset
coil cord.

As for keying the transmitter, the Heil mike comes with a 1/4 inch
phone jack wired into the mike connector. I use a SPST foot switch
connected to that to key the transmitter. The same system is used
on Heil mike cords for the Goldline series mikes.

The Koss is not a light headset, but it does a great job of blocking
out ambient noise. Sort of like wearing shooting ear protectors
with speakers in them.

If you use another headset without an integral mike boom mounting
stud you can just hot glue a 1/2 inch 10-24 screw to it and use
that for the stud. I've done that on other headsets and it will
hold up just fine.

Thanks Bob. I wasn't thinking about measuring it from a remote
receiver. I was assuming I would have to measure the output of the
tone generator in the IC-28H. My IC-746 doesn't have a discriminator
circuit, but my old IC-211 does. I will try that. I have an HP-5328A
counter locked to a GPS time standard receiver, so test equipment
won't be a problem.

I've seen surveillence cameras being sold that transmit in the 70cm range and the ad clearly states that you must have a ham license to use the devices (although I am sure they'll sell to anyone). They bill them as being for "ATV" use, but they're in a catalog full of covert surveillence items. Try telling me that the intended use is for ATV.. yeah right!

My Alinco 150 has a cstss scan, that will identify a tone. Perhaps other recievers do as well.

No different than the GMRS radios which mention in half point type on
page 43 of the instructions that you need an FCC license.

It's not illegal to sell them, it's not illegal to buy or own them, it
is not illegal to listen with them. This gets the manufacturer and
retailer off the hook.

The only thing that is illegal is transmitting with them.

I won't even get into all of the 10/11 meter (wink, wink) high power
amps sold at stores that no licensed ham has ever been inside.

People assume that the odds of being caught are low, so that's almost
the same as legal. Some get surprised with major fines.

Happy trails,

This radio is in good working and looking condition.
26-29.695
It has a built in preamp with switch on back.
The preamp works great.
It has ajustable power on the swr/cal knob.
Has been tuned and peaked.
Modes am fm ssb cw
Comes with original mic with up/down buttons power cord and mountting
bracket. $210
lower 48 states.
E-mail for picture.
Paypal prefered or postal money order.

> Have you tried SIN / TAN ?

There is no signal provided. On earlier versions of the radio (TM-201 and TM-211 series, including the 401/411), I was able to trace the "busy" signal strength display LED back to a COR/COS signal.

With UNSQUELCHED RX audio coming out of the microphone port (pin 6), perhaps some sort of white-noise ignoring VOX circuit external to the radio will work if you can't find a suitable place to tap the signal from inside.

Source record: 32278

Hi:
I seen a few post on an optional AM filter XF-117A for AM. The
AM receive seems to be fine on this radio, but the transmit audio is
poor. Poking around, I find the AM TX goes through the same SSB
filter (2.2kc) as SSB TX, but the carrier is shifted a bit to bring it
closer to the crystal's center freq. Well, this just drops the
cut-off even more. I can't seem to find a menu to change the AM
carrier frequency.
I suspect the optional AM filter replaces this 2.2kc crystal
filter. SSB is fine and I really don't want to spread that out too
much. But, the AM-T signal is in that circuit and I think I can
switch the SSB filter out and maybe a ceramic one in with an analog
switch, in the AM transmit mode, which would be ideal.. RF at this
point is only 455kc..
ANyone ever do the AM filter change? Does it spread the SSB out?
Thanks!
Harry

That's good to know. I though maybe we were being invaded, but
if these devices adhere to these rules, it shouldn't be an issue. Should
be no worse than say noise from a thunder storm.

Well, I didn't know what level of sophisticated troubleshooting you were up to, so I started simple. With a schematic, you can certainly probe the output of the tone generator in the radio. However, the level is likely to be quite low, and finding a point where you can probe it without shorting any nearby components might prove difficult.

Certainly another receiver with a tone scan would help, but almost any adjustable PL receiver can find the tone if you're willing to scan for it yourself. To me it just seems simpler to key the radio up and have something display the frequency - then you'll know.

If you set your counter for a 10 second gate, you can read the frequency down to tenths of a cycle. Don't expect the PL tones to be exactly on frequency as these synthesized PL generators do the best they can to cover all frequencies within (probably) half a cycle or so. The original Motorola and GE vibrating reed encoders were much more accurate.

I have a Panasonic RF-B11 4 Sale.

Panasonic RF-B11 Information:
FM/LW/MW/SW 12-Band Receiver.
9 shortwave bands.
3" Dynamic Speaker for outstanding sound.
FM Stereo with Optional Stereo Headphones.
DC-in Jack.
AC Operation with Optional AC Adaptor.
Tone Switch (high/low).
LED Tuning Indicator.
LED FM Stereo Indicator.
Stylish Design.
Band Indicators.
Stand and Hand Strap Included.
Batteries 2 x AA

The Panasonic RF-B11 is like new and in excellent condition. No modifications have been done to it.

The selling price of $40.00 includes shipping and insurance costs within the continental United States via the U.S. POSTAL Service. Payment with a

U.S. POSTAL Service MONEY ORDER is preferred.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

Contact Yaesu or check your owner's manual, but in most rigs, the AM
filter does not replace the SSB filter; it only switches in when the
AM mode is chosen.

You are, of course, authorized to use MARS/CAP frequencies.

Work backwards by looking at the mods first, at sites like
http://www.mods.dk/

Keep in mind that your warranty may disappear when you open the case.

433 mhz - 435 mhz is listed as FM simplex in the band plan. Sounds like you and your fellow hams in the area need to QSY to those frequencies. If it happens to interfere with car alarms, then that's the problem of the car owners, isn't it? ;)

I have an Icom IC-W32A for sale. With the exception of shipping tape placed over the display lens (I do this to all of my H/T's to protect the lens, and it is easily removable) the radio is in as new condition. It will be shipped in the original box with manual, quick programming card, stock duck antenna, battery and charger. In addition, I will provide a registered original RT Systems software disk.

Asking $200.00 O.B.O. + shipping from 11786

Please e-mail off list with questions.

Thank you,
John, KB2COP

Couldn't tell you which is best -- but some of the Alinco handhelds
have built-in MARS/CAP capability, and can be field activated. Some of
the Radio Shack handhelds also have MARS/CAP built in.

Not sure whether the standard antennas will work, as is, though,
without high SWR.

Hi,

I am interested in a foot switch to activate "automatically" the PTT while in TX/RX in front of my mic.

The Heil Sound model FS-2, http://www.wimo.de/heil_e.htm provides 2 connectors that look to 2 large headphones plugs. How to plug them ?

What is requested to connect such a device to a RTX, what kind of connectors are used (e.g.my Kenwood is using a 8-pin for the mic entry and the ordinary large plug for the headphones) ? How such a device works ?

Thanks

Thierry

You can wire your own, or spend money for a commercially made one.

Also keep in mind that a lot of surplus industrial equipment has foot
switches, just make sure you get something that shuts off positively
when you unkey.

From the web page you indicated:

" Comfortable foot switch with large surface, space enough for the whole
foot. Two separate connectors, eg. one for Tx and one for PA. One of the
connectors closes earlier than the other."

For what you are trying to do you would use the plug labeled for Tx.
The one labeled PA is for keying an outboard linear power amp, so you
don't need to use it.

Look just above at the FS-1. It's the switch you really need to use
for what you have described. It is just a simple SPST foot switch
with one plug.

As for how to connect it, if you use a Heil mike and cord set that you
specifically ordered for your Kenwood from Heil, all you have to do is
plug the supplied mike connector into your rig and the footswitch into
the jack provided on the mike cord. Nothing could be simpler. You
won't have to wire anything up yourself. The headphone plug goes into
the headphone jack on your rig.

Thierry,

I am using a similar foot switch with my Kenwood HF radio.

Check your radio to see if you have an Accessory jack on
the rear panel. If you have it, look in your manual to
see if there is a PTT connection available on that jack.
If so, that will be the easiest place to connect the foot
switch. You will need the correct connector to plug into
the radio, of course. Connect a short length of shielded
wire to the PTT and ground pins, and connect the other end
of the shielded wire to a 1/4" inline female jack. Plug
the foot switch into the 1/4" female jack. Connecting the
foot switch in this manner will allow you to connect your
regular microphone to the 8-pin connector on the front panel
with no interference and no adaptors necessary.

Simple, and it works well!

73,
Dean K5DH

I have for sale a new Kenwood TM-V7A dual band mobile fm transceiver. I have never removed this radio from the box. I bought it from AES and thought I would be installing it in my car. I installed a 706 MK II G instead. Nothing has been removed from the box and is currently sitting on a closet shelf. I have a new comet dual band antenna and mount with coax that has never been out of the packages also which I will be selling after the radio goes.
I am asking $375.00 plus shipping for the radio from 48026.

2841. ADI HT question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-20 01:59:22 UTC
From: Toscano <toscano2@ix.netcom.com>
Message-ID: <b5at4v$5tm$1@slb6.atl.mindspring.net>
Source record: 32168

I own an ADI AT400 70cm HT. To me it appears that my radio shares battery types with the AT201, AT401, and AT600. It is extremely difficult for me to locate batteries for this HT since mine needs replacing. I am wondering what other ADI/Pryme radios would work with my radio.

Thx and 73s de KB1ILS

2842. FS: ICOM IC-735 Transceiver

Given that MARS uses frequencies near 148/143Mhz, and that you are asking for other frequencies, it is a good bet that you are not wanting this for MARS operation. You may want to hold tight to your wallet and your license... ;-)

that's right all, we are up and running, the long awaited "radio shop" (catchy name) is up and running at full speed, we repair and align CB's , ham and "other" radios, we repair and tune amps, mostly tube type amps, but give us a yell for other prices for amps, we also sell CB'S and HAM equipment, so drop us a line at k5kdi@cableone.net for any questions or the address to send repairs, or even just to chat, or if you are in the Odessa,TX area stop by the shop, we are located at the corner of university and Dixie in the back of the antique shop, let the spouse check out all the pretty stuff up front while you come talk radio with us, we will make you a great deal!!!!!!!!!!!

tell your friends, you wont be disappointed!

thanks!
Ken.

2852. AN HT THAT TRANSMITS ON 2 METERS AND THE AIRCRAFT BANDS

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-20 16:09:21 UTC
From: Murray Green <mgreen@erols.com>
Message-ID: <3E79E7B1.9944B31B@erols.com>
Source record: 32184

Yup, that's right. YAESU apparently has come out with a "first". An HT, model VXA700, that "transmits" and receives both in the 2 meter FM band and the aircraft AM spectrum. At least that is what the ad says on page 119 of the April issue of QST. While it is illegal to transmit in the Amateur and Aircraft bands without a license, the units are being sold over the counter or via the internet or telephone. I suspect there is a market for hams who are pilots. However, in the hands of the wrong person..... I believe that over the counter sales of pure HT aircraft units has probably been around for a long time. YAESU just got the idea to have one unit type accepted for both services for sale in the U.S.

Yes I have. I am just trying to prevent it from happening to someone else.

2862. TS-440SAT - how do I centralise passbands?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-20 20:12:59 UTC
From: "Richard C. Ferryman" <Richard.Ferryman@btinternet.com>
Message-ID: <228k7vs1c18jui7ihm4i8qsubghirhp048@4ax.com>
Source record: 32194

When switching between M2, M1 and N passbands (all three filters are fitted) the IF shift varies. I believe the 'bfo' frequency is presettable as well as the pbt control range. Is there a procedure to be able to align them so all come on the centre of the pbt control (so each sideband is balanced).
Richard

>off in the tone generator. My question is, how would you measure a PL
>tone in a transceiver? I don't have a service manual for the IC-28H.

PL tones are FM modulated onto the carrier, just like voice. Indeed,
they are normally simply injected into the audio circuit at some point.
PL deviation needs to be set properly for the tones to work well,
although most receivers are quite forgiving of misadjustments.

Some time ago I tried to find a reference on the internet for
setting PL deviation. There is not much out there. My old Azden
3000 Service manual specifies 500Hz deviation, and that seems
about right. http://rangerusa.com/align1000.html recommends 600Hz
nominal, and specifies setting the receiver PL circuitry to trigger
at 200Hz deviation or better.

Be aware that many controls may affect deviation. First, ensure
your maximum deviation control is set properly (about 4500Hz).
Next, adjust audio gain for good sounding voice. Only then set
your PL deviation.

Good luck,
Rob

2867. FT-857 question?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-20 22:07:14 UTC
From: Vito Liberatore <vliberatoreREMOVETHIS@denardis.com>
Message-ID: <BA9FA5C2.10BC%vliberatoreREMOVETHIS@denardis.com>
Source record: 32099

1. Do the buttons change color with the dot matrix display?

2. Does the radio include an SWR reading function? If so, is it similar to the 706MKIIG SWR read (scope) function? I'd like to be able to setup without a separate SWR meter.

A 706 is stretching my budget, I'm trying to figure if the 857 is worth the extra cost. For the first year I would be using the radio more for VHF-UHF all mode ops and HF listening (75% mobile 25% base). With a license upgrade I'll be using it for HF voice as well.

2869. Re: How To Measure a CTCSS Tone

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-20 23:18:41 UTC
From: "Bob M." <xxxxx@yyyy.zzz>
Message-ID: <LaadnRQXK8Lf0eejXTWcoA@comcast.com>
Source record: 32101

My experience with Motorola equipment is that they want the PL tones set to a value between 700 and 850 Hz deviation, and the main "total" deviation somewhere around 4.5 KHz. I did some experimenting with a signal generator feeding a MaxTrac receiver and found that the PL decoder would work down to under 100 Hz deviation with no other audio, and required around 300 Hz with a 1000 Hz tone deviating the carrier 4.7 KHz.

I usually set deviation to 5 KHz because a lot of people tend to talk very softly at times. I also set PL tones to 500 Hz deviation, or 10% of the total. I have never had a problem with these levels.

Naturally, your mileage may vary, slightly different elsewhere !

> Kenwood TS830S?

Main difference is in the receiver: the 830 has a double-conversion RX,
as opposed to the 530's single IF. Then there is a VBT (Variable
Bandwidth Tuning) adjustment and a notch filter, which the 530 does not
have. Get an 830 if you have a choice - the RX is worth a $100 or so
difference.

530 is single conversion super-het. 830 is a triple.
That is the main difference.

Even better, if you haven't already, is to file a USPS mail fraud report,
especially if the address is valid. I think that's a pretty serious crime.

good luck

OK, I know very little about the cell phones in general, and less about Nextel "two-way radio" phones, especially. I am, however, really baffled about some relatively recent advertisements for those phones that make no sense to me.

The television commercial starts out with someone getting off an airplane, then goes to a split-screen with two scenarios of that one person - in one, the guy tries to call someone on his cell phone to get a ride home. No answer. He struggles through the rain to a taxi, and life gets worse from there for the poor luck-less guy with an ordinary cell phone.

On the other side of the split screen, the same person has a Nextel two-way radio phone. The party they "radio" immediately answers, and rushes out to rescue the weary traveller. Life is rosy, and all because he had a Nextel and used the two-way feature.

Huh???

I ask you: Why the heck would someone with a "two-way radio" phone be any more likely to reach the party they are calling??? Seems like raw BS to me. Or am I missing something? IS there any advantage to those dumb things at all?

More marketing BS. You are just as likely to be in an area where NEXTEL service sucks, or the other party isn't there to answer the phone.

The 830 is dual conversion. In a way I still consider it a single, but
the other IF filter I guess qualifies it as a dual. They call it a
dual conversion in the manual. MK

I used the schematics and an IFR. The AM TX definately goes through
the same SSB filter. I'm sorry, I didn't even mention the radio.
It's a FT-847. With the IFR, I can see that the AM is really just USB
with a carrier. There's a sort of diagnostic mode that's entered by
pressing DN, FAST, and UP on the mic while turning the radio on. This
did wonders for the SSB audio and digital modes like DIGSSTV. I'll
have to check with Yeasu. Thanks!
Harry

In my AES catalog, I notice Yaesu offers an AM filter for some of
their rigs, but they don't list one for the 847, so there may be no
extra slot to stick one in. You could check International Radio, their
website.

http://www.qth.com/inrad/

They sell after-market filter-switching schemes for some radios.

I have for sale a new Kenwood TM-V7A dual band mobile fm transceiver. I have never removed this radio from the box. I bought it from AES and thought I would be installing it in my car. I installed a 706 MK II G instead. Nothing has been removed from the box and is currently sitting on a closet shelf. I have a new comet dual band antenna and mount with coax that has never been out of the packages also which I will be selling after the radio goes.
I am asking $350.00 plus shipping for the radio from 48026.

Thanks. I contacted them and it is just an owner's manual. No
schematic or service info. But it's a start.

I got one private response who claimed that these things don't even relay through a cell tower that they are true two-way radios. Sounds wrong to me, though - it was my understanding that they claim a 300 *mile* radius of operation. There's no way that would be true for handheld microwave devices unless they use a tower-based relay (or a whole network of them).

Can anyone confirm whether the two-way radio feature operates via relay tower? or whether these devices are *capable* of direct unit-to-unit communications?

On a related vein, are many current police two-way radios capable of direct car-to-car communications? Do they generally depend on a central repeater? Are they completely out of luck when the central tower goes down? or are some police systems more flexible and failure-resistant?

2895. CW on FM

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-21 20:31:39 UTC
From: cprstn54zz@att.net
Message-ID: <3e7b7472.27253171@news-server.optonline.net>
Source record: 32127

I have tried to TX CW on 2M FM using PTT as the key. Receivers set to SSB or CW pick it up OK.

However, when I try to received a CW signal on FM, I get a 700Hz tone only way off to the side at maybe S2, whereas the carrier (no tone) gives me way over S9.

Is this just the way it is, or are there some tricks that will improve receive?

This is something for possible emergency use -- like in the movie (K2?)

Amazing......well here is the 'skinny'. CW, or on off keying, is received properly by using either a BFO (beat frequency oscillator), or a Product detector. The purpose of both is to superimpose a carrier on the incoming signal. This is then heard as a "tone" in the receiver.

A FM receiver has neither.

A CW signal must be received on a AM receiver. Not a FM discriminator.

However...if one wants to use a FM transmitter and Receiver to send a mode known as MCW (Modulated CW) you can do so with a tone oscillator on the TX and it will do fine.

Hope this helps a bit.

Hi, Dan.

I guess this means I'd better get good at reading the S-meter, because
there is no way a remote station set for CW or SSB can know that the
signal it is receiving from me is MCW. It will just send back a sine
wave on SSB, which I can't hear.

OTOH, if there is a designated MCW frequency, I guess I could be
copied there by humming into the mic and keying CW with the PTT. I
would hear that station OK on FM because there would be an oscillator
tone.

Hi all, Do you have a Cadex C7000 Battery Analyzer/ Reconditioner?
Do you have any battery adapter cups that you can't use??
Cadex made battery cups for hundreds of battery types.
Many C7000 units are picked up used and the cups are useless to the
new owners.
If you have some of these collecting dust, I'd like to get them from you.
Please let me know what you have. We can work something out.
Please e-mail me direct at:
mrrusso@optonline.net

THANKS, Mark

>

Yes, it has a SWR function. It is a very small disply going vertical on the
small display.
It appears to just be bars. I can't tell whether it is 1.5 or 2 or ..., but
certainly shows fewer bars for lower SWR.

> A 706 is stretching my budget, I'm trying to figure if the 857 is worth
the

> I'll be using it for HF voice as well.
>

You will have to decide this. The 706 has been around awhile and appears to
be solid at a lower price. The 857 is my first mobile HF rig. Maybe I just
wanted the 'newest' one out. I know this can be dangerous but I went for it.
Check out http://groups.yahoo.com/group/FT-857 for more comments on the 857.
There is also a group for the 706. I read and reviewed both of these groups,
and the FT100 and FT897 groups, before getting my 857.

How to transmit and receive Morse Code using a NB FM transmitter and an FM receiver -

S'easy - just plug a keyed audio oscillator into the microphone socket.

Sounds beautiful. Excellent signal to noise ratio when above the threshold level. Off-frequency interference completely disappears. No fading - constant volume from receiving loud speaker. Carrier frequency drift - not the slightest effect. Carrier chirps and key clicks gone forever.

Small price to be paid:- The PA runs warmer than a keyed carrier.

But then, even in the days of spark transmitteres, an increase in transmitter power output always did result in improvements in signal to noise and signal to interference ratios.

Introduce a 20 wpm Morse test qualification.

Reg, GF4FGQ

<< I have an old Icom IC-28H that seems to have a tone problem. I can access one repeater with a 100hz tone, but not another with a 162.2hz tone. It is not a matter of signal strength. There must be something off in the tone generator. My question is, how would you measure a PL tone in a transceiver? >>

Dick-

Without the service information you may not be able to correct a problem even if you find it. I suspect the IC-28H CTCSS frequency is determined by a crystal-controlled oscillator, so accuracy is not likely to be the problem. Unless there is a bad CTCSS deviation pot, I wouldn't expect deviation to have changed since being adjusted at the factory. In other words, I think there is another problem such as RF from the transmitter output getting back into the oscillator circuit.

Does the IC-28H have tones selected by DIP-switches inside, or is it capable of being programmed for a separate tone on each channel? If it uses DIP-switches, you may merely have the wrong switch set-up for the problem tone.

I recall an alignment procedure for an old Motorola radio, that just said to measure the CTCSS deviation. If it was anywhere between 500 Hz and 1KHz, it was to be considered acceptable. That radio did not have an adjustment, so parts replacement would have been required if deviation was out of specification. I generally aim for 750 Hz but don't think it is critical.

To measure frequency? The best way I can think of is an indirect "Rube Goldberg" measurement using another receiver, an oscilloscope, an audio oscillator and a counter that has either a ten second time base or is capable of measuring period in terms of time between alternate zero-crossings. You need to connect the oscilloscope to the receiver's detector output. Set the audio oscillator to the approximate tone frequency, and use the audio oscillator's signal to synchronize the oscilloscope's sweep. Adjust the sweep frequency so one or two cycles of a sine wave are visible when the receiver is receiving the problem signal. When you adjust the audio oscillator so the sine wave stands still, you can count the frequency of the audio oscillator and see how close it is to ideal. (If it is way-off, you may have adjusted the audio oscillator to a harmonic or sub-harmonic.)

To use a receiver as a deviation meter, you may be able to DC-couple an oscilloscope to the detector output and note how many screen divisions are equal to a known frequency change. Then, with AC coupling, you can read the PEAK-TO-PEAK value of an incoming signal's deviation. Keep in mind that for a sine wave, you divide peak-to-peak by two to obtain peak deviation.

It would be nice to have a good service monitor, but as you can see, a lot can be done with more affordable equipment.

Its been what 2 years since the FT-817 and about the same since the VX-7, then there was the TH-F6a from Kenwood also more then 2 years ago!
I think last year ICOM finally released the VX-5 clone! What was it the IC-T90?
Any body heard any thing new on the horizon? I half expected with the popularity of the FT-817 manufacturers would be falling over them selves to come up with something new. I think the FT-817 has one of the largest communities of any group worldwide on Yahoo thats go to say something for its popularity.
I would have thought Icom to do something similar, maybe water resistant with a bigger battery and maybe a built in tuner?
Any body seen any thing new?

Cheers
Eric.

Check the band switch before buying. You cant get these items anymore. The 530 has the same switch as the 830s and when worn can give you lots of trouble. Other than that its a excellent radio. The 200 watt mod works well giving between 150 and 180 watts out. Stay away from a unit that CB boys have been playing with. They wear the tuning coils out on ten and its hard job replacing worn out tuning coils or getting replacement ferrite for the cracked ones.

The Icom 703 is out soon. Its a 20 watt 706.

817 is a nice toy. But the receiver stinks. The battery packs far too expensive and have a short operating time. Something like a true military backpack with 20 watts would be nice. The drop in the sunspot cycle will soon take the romance away for these radios, life is indeed too short for QRP.

Look at the Aussie Made QMac radio now there is piece of equipment that should be popular. Just goes to show whats better or the best does not always outsell crap like the ft817.

As for these handhelds most of them are crap. Its a pity nobody can build a decent small shortwave receiver with decent receiver into a handheld. The Tokyo High power handheld would be huge success if it was all band HF. Every new model seems to be a disaster or full of manufacturing bugs.

I will leave my money in the bank, or keep saving for something good like Alpha 87.

The B&K E-200C and E-200D are completely different.
The latter is solid state.

I owned (and sold) both.

Schematics were furnished with the user manuals
and I never saw a separate service manual.

<< When switching between M2, M1 and N passbands (all three filters are fitted) the IF shift varies. I believe the 'bfo' frequency is presettable as well as the pbt control range. Is there a procedure to be able to align them so all come on the centre of the pbt control (so each sideband is balanced). >>

Richard-

When you choose USB, LSB and CW, different carrier oscillator crystals (or VCO voltages) are selected. The IF Shift control varies the carrier oscillator frequency slightly, effectively moving the filter's bandpass. Each oscillator could be adjusted in the TS-430, but I don't have information on the TS-440.

With the IF Shift control centered, you should hear the same noise pitch when switching between USB and LSB. Even if adjusted per the service manual, you may find that a filter itself isn't centered between the USB and LSB settings. If that is the case, then replacement of the filter would be required to perfectly center it. If you only had one filter, you could adjust one or both of the oscillators until USB and LSB sounded the same. With more than one filter, a compromise may be necessary.

<< I need to find about 600 feet of #10 or #12 Copperweld antenna wire. I need to get the good quality { not lighter type copper covering}. Can anyone suggest a good place to buy it? >>

Byron-

Years ago, I heard you could buy copperweld electric fence wire at farm supply stores. The price was reported to be much better than for copperweld intended for antennas. I suggest a web search for "copperweld fence" or "electric fence".

<< I have tried to TX CW on 2M FM using PTT as the key. Receivers set to SSB or CW pick it up OK.

However, when I try to received a CW signal on FM, I get a 700Hz tone only way off to the side at maybe S2, whereas the carrier (no tone) gives me way over S9. >>

Ken-

I first got on Six Meters back in the sixties, before repeaters were very widespread. Most of the Six Meter rigs of the day were Amplitude Modulated, and many were like CB sets just made for a different frequency. That was the day of the Heath Sixer and Gonset Gooney Box AM transceivers.

Although infrequently done, it was common at the time to use MCW to send code. You could key the push-to-talk to send true CW, but no one could receive it. If you sent MCW, everyone could. Since many of the Six Meter Hams were 5 WPM Technician class, some clubs would broadcast code practice using MCW, so members could upgrade to 13 WPM General class.

If you want to have code available for emergencies in the world of Two Meters FM, MCW would be the best choice. However, I doubt it would offer much advantage over voice unless your microphone went bad at a critical time. In that case, you could send MCW and others could talk back to you by voice!

If you are serious about Two Meter CW, consider getting a rig like the Icom IC-706 or the Yaesu FT-100.

> (K2?)
>
> Ken KC2JDY
>

Find out where the 700 hz tone is comming from. It should not be there. With the PTT not pressed the transmitter should not be puting out a signal at any frequency. When you press the PTT and do not have any audio to the mic input you are putting out a carrier just as a CW transmitter will . It must be received like a standard CW signal on a receiver deisgned to receive CW (or ssb). When a carrier (CW signal)is received on a FM set it just quientiens down the background hiss or noise the same as when you are not talking into the mic. It just bucomes quiet and then noise unless you have the squelch turned up, then you may hear a few clicks.

If the code is sent slow enough then it probalby could be understood well enough to get the message.

The E-200C is tube, while the E-200D is solid state. Totally
different.

I called B&K, they no longer have service info on the E-200D. They
referred me to this place: http://www.bktestequipment.com

Evidently they bought the copywright to all pre-1985 B&K materials.
They must have paid big bucks, because they charge big bucks. They
charge $25 for an owners manual and $35 for a service manual. And
don't forget to add $5 shipping.

Their prices are insane, I can't imagine that they sell much. There's
no way I'm gonna pay those prices. I only paid $25 for the signal
generator!

I really wanted a service manual, but I probably won't find one. But
I will probably find a copy of the schematic somewhere. I'll keep
looking...

2940. Uniden Bearcat 200XLT Scanner 4-Sale

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-22 16:51:04 UTC
From: "Rodger N. Bird" <rbird2@peoplepc.com>
Message-ID: <MPG.18e65e81772160ca9896d9@trialnews.peoplepc.com>
Source record: 32070

I have a Uniden Bearcat 200XLT handheld scanner (with cellular coverage) for sale. A few features listed below:

Channels 200, Banks 10
Coverage 29-54 118-174 406-512 806-956 MHz
Priority 10 channels, Delay, Lockout, Keypad Lock
Instant Weather
Display Light
Power: 12 volts
Size: 2.75(W) x 1.25(D) x 7.5(H) inches
Weight: 20 ounces

I have the antenna, case, 2 BP-200 rechargeable battery packs, wall charger/adapter, car charger.adapter, and a copy of the manual. I do not have the original box or original owners manual.

The 200XLT is in fair condition and works fine. Both batteries are good and hold a charge, one of the BP-200 batteries is brand new. There are some scratches on the case and display. The selling price of $80.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

Bob;
The NEXTEL radios will only work when each are in range of NEXTEL towers. The term "direct connect" is a misnomer. They do not have simplex/talk-around capability, nor will they operate with a conventional repeater. They are TDMA only no FM capability is offered in those radios. Although the technology exists to combine these modes, due to their respective marketing strategies, Motorola and NEXTEL have chosen not to offer a radio with these combined functions.

Public Safety radios are supposed to meet APCO-16 standards at a minimum. APCO-16 requires (among other things) the radios to be capable of operating on conventional simplex (talk around) and duplex (repeater) modes in addition to trunked modes. This is for interoperability purposes and to a lesser extent provides back up communications in the event users are out of range of the "system" or the tower fails.

Public Safety systems are constructed to provide a level of equipment redundancy and signal reliability that would not be economical to the commercial market which NEXTEL serves.

NEXTEL radios should NOT be used for public safety communications (I will probably get flamed for saying this).

Joe

> advantage to those dumb things at all?

Bob, it's very simple. You get off the airplane turn on your cell phone and ... oops no coverage or an overloaded network. There goes your phone call. What do you do? Reach in your bag, get out your HT and use the local 2m repeater to make a phone call.

The Nextel service is the same idea except that the phone combines an 800 mHz trunked radio with a cell phone. These days most companies are moving away from 800mHz trunked radio to cell phones as they give better deals on airtime. So the 800mHz repeaters are often underused.

Here in Israel, Motorola owns an 800 mHz trunked network that was so underused they started selling phones for it and marketing as a cell phone service called "Amigo". It's not a cell phone service, it's trunked radio, but the user can't tell the difference.

The local cell phone companies sued saying they were operating an unlicensed cell phone network. The court ruled that it was trunked radio, no matter how they packaged it and they were allowed to sell it.

In an "emergency" there are going to be few folks out there with CW or SSB receivers on 2 Meter FM. There are more now than a few years ago with the advent of the Icom 706 and the like, but realisticaly most 2 meter rigs are FM only. And, what if the only person who hears your signal is a "No-Code" Tech?

If you have a microphone, why not just talk into the danged thing?
Certainly, you'll have a better chance of making yourself understood
than in trying to find someone on 2 meters who copies CW :-)

Personally, I use an Icom IC-W32A and most Icom dealers will perform the mod for you without cancelling your warranty. Although I'm not connected with MARS, being in Canada but I do work with the Air Sea Search and Rescue (millitary) and have no problems with W32A. In fact I think I seen some one trying to see one on here earlier.
The W32A is a dual band and will sub as a cross band repeater as well. It does have two complete radios in one case. I had to look to find mine. and I am very satified with it's performance.

OK, not exactly an amateur radio, but this is where those in know hang out.
I want to find an operator and field programming manual for the
Vertex/Standard HX240. I would also like to know where I can get the
programming software. Does this radio program through the speaker/mic port
or some other way?

TIA,

Roger

Sorry to not have seen this sooner -- I thought
the final post had been done some time ago.

Thanks for the schematic.

Question: the left, you have it going through the
56k omhs to what? Seems to stop mid-air.

Or do the two join together after each go through
their own resisters?

Thanks

David

---

My plan was to head over to radio shack tomorrow and
get the earlier-suggested attenuator cable. Which
I'll probably do, unless everyone from before
follows up and says to go your route.

2982. 3-500Z repair

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-23 14:24:07 UTC
From: Hans Kappetijn <hans@qrv.co.za>
Message-ID: <3e7dc439$0$228@hades.is.co.za>
Source record: 31965

Several of my Eimac 3-500Z tubes have a recurring filament
connection problem. Resoldering a filament pin only had a
limited lifetime.
Having removed the bases of these tubes revealed that the
particular pin giving trouble had no tinning and attempts
to tin it with conventional heat and solder/flux does not
work.
The solder does not take to the pin material although the
other pins are tinned very well.
Has anyone done such repairs and with how?
Do I need a special flux or more heat or what?
I have heard of people silver-soldering them but I do not
have such facilities at home.
Hope to hear some suggestions.
Thanks,
Hans

The pins are Stainless steel, and must be silver soldered, using acid core high silver solder. First clean the bare pin with sand paper, then coat with paste flux, and solder it.
The root of the problem is lack of adequete tube base cooling, you'll need to put more air flow there to keep this problem from happening again.

I have for sale a mint Yaesu VR-500 wide band receiver with accessories. This radio was bought at Christmas and has been only used indoors for not more than 1 hour total. This is an excellent all mode wide band receiver. It covers 0.1-1299.99995 and has 1000 memories. I am including the Yaesu CS-72 soft case, never used Yaesu FNB59 rechargable battery and the Yaesu never used NC-60B charger. This radio was only used on disposable AA batteries. I am the original non smoking owner and have all of the boxes, paper work and warranty card. I am asking $225.00 plus shipping from 48026.

I would never do the high power mod on a kenwood hybrid rig. You
increase distortion a good bit, and the power supply componants are
not rated to handle the increase. They won't last as long if you do
that mod. Besides, the increase from the normal appx 100-120 watts
output to the modified 150-180 watts would be nearly unnoticable on
the air. Less than a 1/2 S unit. I consider that mod a "CB boy mod"
also....:/ BTW, you can find metal couplers to replace the plastic
ones. Someone here mentioned a source for those a while back. Forgot
where though.. MK

For the coax, try www.cablexperts.com . Amidon and Palomar would have cores,
but I don't know what the exact urls are. If nobody else comes up with it, I
can find out about the teflon coax.

2996. FS: ICOM IC-735 HF transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-24 02:19:02 UTC
From: Larry Gagnon <lagagnon@fakesprint.ca>
Message-ID: <nkqs7voerp926o7o995ittub7mm2r2k5cv@4ax.com>
Source record: 31978

I have for sale my trusty ICOM IC-735 HF transceiver, selling due to long term travel overseas and so I want to downsize my radio posessions. The IC-735 is one of ICOM's most successful and reliable HF transceivers, with a respected hot receiver, all the features you need and a great signal. This unit has been used mobile once in a while, but that is a feature not a negative, because you can be assured this radio works under all conditions. It does work perfectly and includes the front plastic door. As a bonus this radio has the following options:

1) 250Hz CW filter
2) inbuilt CW keyer option
3) a full SERVICE manual
4) mod for full transmit

Besides the options it comes complete with microphone, mobile mount, DC power cord, manual.

This radio is in good cosmetic condition. It is a great radio...you will be happy with it.

My asking price is USD $400, plus you pay shipping via your carrier of choice.

Just thought I would update to the previous thread that was fun to read for about a week. if you remember I told of the r390 I found in the trash here in Philly. well...a ham friend of mine stopped over last weekend and saw the r390 sitting on the floor and asked where did it come from? so I told him the story and he replied" well I guess it was the right price for that old thing." well a couple of days later he calls me and says" I am over a friends house (ham 80 yrs old) and I am helping him clean out his basement and he has one of those old radios you just got. the old man says you can have it if your interested. so I ask when can I get it? my friend says don't worry I will drop it off sunday. well its sunday and he pulls up in my drive way with his pickup and says I have something for you and I am not carrying it, so I go over to the back of the pickup and there is a r390a sitting there. I go from no r390's 2 weeks ago to having one of each; r390 and r390a today(and no out of pocket expense). well I plug it in and man does it play.has all filters and all covers and both meters but no 3tf7 tube. has a mod of a resistor and a small lamp in series. well it works. now if I just get the r390 to play I can do side by side comparisons of the two receivers. what I need now is the front builder plate for the r390a and a bottom cover for the r390. oh yeah I put out a request for the rf slugs in the r390 and friend of mine offered an old rf deck and will give it to me in timonium this weekend.well now I will just sit back and wait for the t368 to be dropped off....well I can dream can't I?

Dave,

Thanks for the suggestion. I had the OSH 6-in-1 driver somewhere in one of my tool boxes. I located it this weekend, as always while looking for a different tool. BTW, you mentioned buy the tool at Orchard Supply Hardware. I live in South San Jose. What is your home QTH ?

The instructions for your modification were excellent. I now have a 7-in-1 tool that works on the SMA nut.

I looked at the wrench offered on the Pulse Research site you mentioned. It looks like it is for the nut on the connector and would not work for this task.

Thanks and -73-
Charlie KD6VIZ

3004. Radio Shack HTX-245 Receiver Oscillates

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-24 12:04:51 UTC
From: fmmck@aol.com
Message-ID: <20030324070451.18396.00000238@mb-cb.aol.com>
Source record: 31986

When I first got the HTX-245, I thought the occasional pops were due to the squelch being adjusted too loose. It turns out that something in the receiver is oscillating, and the signal drifts across the channel causing the squelch to pop.

I find that I can hold my hand near the radio and "tune" the oscillation. By holding my hand in just the right spot, I can hold the squelch open. The oscillation signal is strong enough to block a repeater that has good quieting.

Although mine was worse, I noticed the same problem on a friend's HTX-245. Has anyone else noticed this effect? Has anyone figured out what the problem is and fixed it?

May also have a resistive half burned up socket by this time. I'd try
to clean the pin sockets some way or get a new socket if they look
burnt. That could make the pins run real hot also. MK

Source record: 31992

the rig if you turn the RF gain past 8 or the Volume to hight the RX
will shut down and you have to shut the unit down and turn the volume
and RF gain back to 0 then turn the unit back on and it work great
untill the next time. I have traced the problem down to the IF board
PB-1183 it is the same board your filters are installed on. Looking
at the schematic theire is another pot comming off the RF gain control
that runs to a relay coil RL-1 The Pot i am wanting to adjust is
labled level VR3b but i can not locate it inside the radio. I want to
try adjusting it and if that wont work iam going to look at the
trainsters on that board but they have been replaced before. Iam just
getting back into Ham radio and any help will be deaply apperciated..
I have only had the radio a week.

Great - I'm glad it worked out.

This aspect of the VX-1/5/7 design really is a significant weakness...
it'd be nice if Yaesu were to switch to a connector design which would
lock in place more securely.

I've seen some people suggest putting a drop of Loctite on the
connector threads to secure it in place. I suppose that as long as
the nut is tightened down sufficiently to "bite" into the connector
threads, there wouldn't be any ill effect on the electrical
conductivity of the connection. If mine loosens up again I may give
this a try.

>I looked at the wrench offered on the Pulse Research site you

>not work for this task.

Yeah, you're probably right.

I hate buying tools or cables on a "Well, this looks as if it should
work" basis, and then finding out the hard way that they aren't the
right size or gender or whatever...

I used to use Cramolin (red for cleaning, blue for preservative
post-treatment) on all of my audio equipment connectors, and I've
still got a couple of sets of the little bottles of concentrate
sitting around.

Caig reformulated it, I understand, and the current product
equivalents are the DeOxIt and ProGold products.

If it is not broke, set the range switch to the range that is a little under the power the transmitter should be putting out. Then go to the swr switch. in the forward position and adjust it to full scale or the SET mark if it has one. Then go to the reflected position and you should be able to read the swr. This should work even if the power caliberation is way off.

3026. Help using Palomar 500 SWR/Watt meter

Source record: 32008

Hi Folks,

I recently acquired a Palomar 500 swr/watt meter similar to the one shown here on eBay: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3012666805&category=1501

I've hooked it up and tried getting it to do something sensible, but just when I think I have it figured out I find that I don't understand how to operate it. I thought that pushing in FWD and SWR, then using SWR SET to calibrate the meter would work, but then it doesn't seem to give a sensible SWR reading after that using other combos of the switches nor does it seem to read out the power correctly.

If someone is familiar with this beast please drop me a line and give me a clue. Could be it needs calibrating (as you can see it has an adjustment on the rear for each power range 10/100/1000 watts), in which case if you know how to go about that, that info would also be appreciated.

I suppose it could just be broken!

73,

Casey

Rob,

Actually, there are different DeOxit types. I've found the DeOxit 1000 works better than the 5 type. It has a special nozzle, too, that only lets you spray a small bit and shuts itself off, sort of like a pressurized pump spray. Cost more, of course.

What band are you trying to use it on? That meter was originally sold as a 1970's era CB meter, most likely it is only close to accurate somewhere near 27 mHz.... try it on ten meters and see if it behaves any better.

Source record: 32014

Before investigating whether transmitters provide their expected power output I suggest you thoroughly investigate the accuracy of your power meter and the circuit you propose to use it in.

And even then, using amateur grade equipment, you will be lucky if you get in the right ball park. And you will never know whether or not you got into the right ball park.

Power output is not an important parameter. 1/2 Tx power corresponds to only 1/2 of an S-unit on the receiving-end S-meter. Hardly noticeable in practice.

Repost from like a month ago, but here we go again....
[!! crossposted in
rec.radio.amateur.equipment, rec.radio.amateur.homebrew,
rec.radio.amateur.misc]

Hi,

I'm thinking about changing my NiCd cells in the battery for my Yaesu FT-50 Handheld to NiMh type instead. Mainly for 2 reasons:
1) larger capacity and 2) the old ones cannot hold their capacity for longer periods of time anymore.

The battery is of the type FNB-41, 9.6 Volts and 600 mAh. I don't know about the number of cells, their size or voltage, but i bet it is 8x1.2 Volts.....

Does anyone have any experience in opening the battery case for this particular type of battery? I have an idea about the casing being welded (melted?) together rather than glued, and i don't want to break it if i can avoid it or it is a waste of time to try.

Ideas, anyone?

Also, if anyone have any comments on the internal charging circuitry of the FT-50 (if it can charge NiMh or not)... i would be grateful.

73 de OZ2BRN

Usually this is done by flaring the open end of the jack after the
barrel is screwed on. Depending on the quality of the piece, it may
be easy or impossible to remove the barrel without damaging the jack.

We Do minor repair of ham equipment, like the light repair on the icom 746.

We have "Ham" equipment for sale and trade.

We Do work on C.B. Sets also, modulation upgrades, mic wiring, realignement

We can also find a lot of what you want to special order on equipment, and have good prices on top of all this!

Just let us know what you would like for us to do for you today, leave us a message at k5kdi@cableone.net

3041. Yaesu FP-29 schematic needed

They didn't reformulate it, they quit buying it, and decided they could make their own. Isn't that just like most companies.

Tarn-X make silver really nice looking. I have been using Bullfrog now in contention for my favorite
electronic spray cleaner protectors.

I don't have the original instructions for Cramolin, however the Cramolin company now states its Contaclean is to be removed after the cleaning process, and a protector is then applied.

I changed my battery to the NiMH FNB-41 recently and I love it. And I
had the same ideas about cracking open the case and such. But before I
did I did a search the web and purchased one for less than 1/2 the price
(including shipping!) than I could get it from our local ham store.
Check out www.pandacomm.org.

At that price it was not worth the hassle for me.

I'm trying to develop a microcontroller adapter to provide computer control of the RadioShack DX-394 receiver. The adapter attempts to emulate a Drake R8A/B on its RS232 link to the computer. So far, I've been able to get it to accept the Set Frequency command but the application software does not seem to accept its replies. I'm looking for someone who has a Drake R8A or B who could help by capturing its serial comms between either of the Fineware apps during basic start up and frequency setting. This would help determine if my emulator is returning responses in the form that the app requires.

73, Tom

Leigh---I did a lot of research before I ended up with the IFR 1500 a number of years ago. Some things to keep in mind:

--What are the long term costs of maintaining the service monitor? It's not cheap sending a unit back to IFR (but ultimately worth it obviously). And how long will the company continue to support the unit?

--BE VERY CAREFUL if you buy an IFR unit with the analog RF generator attenuator. IFR had Weinshel build those things specifically for them to be continuously variable.....they have experienced a high failure rate with those attenuators, especially (and unfortunately for me) in the 1500. I ended up having IFR rebuild mine with the digital attenuator to preclude having to potentially replace the analog version over and over.

--A guy who specializes in repairing the 500/1200 series is KG Electronics:

http://kgelectronics.netfirms.com/

He can provide you with good insight regarding the 1200 series.

--Probably a blinding flash of the obvious but make sure you get all the capability you're after. For example, having a tracking generator (an option on the 1200) is a great tool for tuning repeater duplexers. Are you buying a unit with a spectrum analyzer built in? There are 1200's that don't (the A model as I recall)---Not everyone needs it but having one offers tremendous capability.

--Units with CRT displays may have been "abused" by having a static display left on the face at high intensity. My unit showed significant "shadows" burned into the CRT face--I had IFR put a new one in when I got the unit; the problem is that replacement CRTs are now getting scarce and expensive.

--It's a tough decision to try to buy a unit from an individual from eBay for example or from a dealer....obvious difference may be saving a few bucks....but the old adage says you get what you pay for....having at least some sembance of a warranty is comforting.

Probably lots more.....e-mail me direct if you want to discuss further.

Good Luck!

I have for sale a mint Yaesu VR-500 wide band receiver with accessories. This radio was bought at Christmas and has been only used indoors for not more than 1 hour total. This is an excellent all mode wide band receiver. It covers 0.1-1299.99995 and has 1000 memories. I am including the Yaesu CS-72 soft case, never used Yaesu FNB59 rechargable battery and the Yaesu never used NC-60B charger. This radio was only used on disposable AA batteries. I am the original non smoking owner and have all of the boxes, paper work and warranty card. I am asking $225.00 plus shipping from 48026.

Haven't tried it myself, but I've heard that putting the battery pack in a
freezer for an hour or so weakens the joints, enabling it to be easily
opened.

Interesting - I hadn't known this. Thanks for the information!

For what it's worth, the Miller-Stephenson company sells some products
which have similar applications. One is MS-730, a zero-residue contact
cleaner. MS-738 is a contact cleaner which contains a fluorinated
synthetic oil as a lubricant... "excellent for relays, tuners, ...
rheostats, ... and switching devices."

Another is MS-381, a connector cleaner/lubricant/protector/
antioxidant which contains a "6-ring polyphenyl ether" as the active
ingredient. MS-381 is stated to have a 20-year film life once
applied, to be non-migrating and silicone-free, and to have "no
interference with electrical connectivity."

>Tarn-X make silver really nice looking. I have been using Bullfrog now
>in contention for my favorite electronic spray cleaner protectors.

Heh! I just checked my toolshed this morning, and noticed that I have
a bottle of Tarn-X in a batch of stuff stuff I inherited from my
grandparents. I'll try this out next time I have some silver-plated
connectors to clean.

>I don't have the original instructions for Cramolin, however the

Good to know - thanks! I always did wipe off the Cramolin Red, and
then wipe on a little bit of the Blue protector.

Not specifically, but if you are not used to working on high voltage
equipment, review safety procedures very carefully.

There is a reason high voltage is measured in KILLovolts.

I believe there are some Yahoo groups and web based forums which focus
on vintage or boatanchor radio gear.

Happy trails,

I used to sell service monitors as a manufacturers rep (not IFR). I sold lots of new monitors over the years and once in awhile I would take a used one in trade if it was in nice shape (any brand). Problem was most every one needed something fixed. Not just IFRs but any of the used ones.

I took a 1200S in trade one time that was in nice shape. But I did notice a slight jitter in the signal generator signal. It ended up costing around $1200.00 to fix that.

Those are the reasons I stayed away from used monitors most of the time.
There are some very nice ones out there but make sure that you go through EVERY function on it to see if they all work properly. No noisy attenuaters, dirty switches, low sensitivity, out of calibration meters, jumpy signal, low signal generator output, loop unlock sometimes etc. They may be simple fixes but most likely they will be expensive fixes. You need to knock off big bucks on the price for anything that is not in perfect shape. They are not cheap to fix. If you have to send one the the factory for repair you can count on a minimum of $1000.00 or more for a simple repair. Just calibration runs $700.00 or more.

The 1200 is a good monitor if you find a good working one. Although they are getting a little long in the tooth. Not cheap to repair though.

> connectors to clean.

A few notes on Tarn-X. The active ingredient is Thiourea. There are two issues with this chemical. It was once used to clean daguerreotypes, which have a layer of metallic silver on them. It kept the silver nice and shiny - until it wore the silver off. The cleaning action dissolves the silver, and eventually it goes away.

The second problem is that Thiourea is a probable carcinogen. I wouldn't worry too much about that, because the occasional cleaning of connectors or coils won't expose you to too much. Don't drink it tho'. 8^)

The stuff works great for silverware, because you have a long way to go before any problem shows up. But silver plating is pretty thin.....

I am looking for an Icom R75 with or without Kiwa or similar mods. DSP is not necessary. Must be in NEW condition. Or an SAT 800 without the hum problem, in NEW condition! I won't pay a new price, so if you're reasonable on price let me know what you have. MUST BE LIKE NEW with no problems!

I have one and get around 100 watts output on all bands. I can't
speak to your problems with the tuner and G5RV, since I don't have
one. I may suggest that you try tuning the transmitter only into a
dummy load and then connect the tuner and ant.

Hope this helps,
Tom

Isn't and IC-27H a VHF FM unit??? If so, an audio filter is not going
to do you much good unless you want to fine tune some repeater ID'ers.

In about 1983 a few signalmen used Tarn-X on railway telephone relays
used to control a hump yard. The contacts looked great, mush easier
than burnishing the relays. In about a 1 week time frame many of the
relay contacts started to fail. They failed to the point the automatic
operation of the hump yard was in trouble. The signalmen had to return
to burnish the contacts of all the relays they used Tarn-X on. I was
there doing technician work for defective equipment detectors when
this happened. I would not use it on anything electronic myself.

Turns out they functioned much better at attracting bombs
instead of deflecting them (one wits words).

It is now reported that 4 out of 7 of the jammers
have been destroyed. Russia smuggled then in inside
containers marked humanitarian supplies alone with night
vision goggles (NVG). The problem is that it jammed
the civilian side, not the military frequencies. And
the military (P) side is not only encrypted but has
frequency hopping (spread spectrum).

There is another approach. I used to use this neat material called
Cool-Amp, which is a paste you rub onto copper, brass or bronze which
plates it with silver. This creates lower contact resistance and less
oxidation.

See: http://www.cool-amp.com/

Neat stuff. You could reapply it and it seemed to work well for
cleaning and refurbishing the silver surface.

I had used this for contacts which were part of a 1000 amp power
supply system, so low contact resistance is critical. By the numbers
with a very sensitive meter, it made a dramatic difference in
performance.

I agree with the other Gary's point that one should use electrical
grade materials in electrical applications, not things that make it
look good.

Happy trails,

VR3b will only be found on the E model or modified EE, EX, or Bs that have had
the speech processor installed. It is the control for the speech processor.
It has nothing to do with the receive IF or audio.

Your problem may be in the voltage regulator. Check to see if its regulating
properly and monitor it while you turn up the volume conrol.

All the GPS signals are direct sequence spread spectrum (biphase
frequency modulation). The military signals are spread over a
larger chunk of the frequency spectrum. See:
http://www.navcen.uscg.gov/pubs/gps/sigspec/default.htm

L2 L1
--------------------+--+---------
1227.60 1575.42 MHz
120 x 154 x 10.23 MHz
| |
| |
Current | C/A
Signals P(Y) P(Y)

Some Military Advantages:
o can operate without C/A being available (or jammed)
o P(Y) clips along at 10.23 MHz compared to the 1.023 MHz of the C/A code
o P(Y) is much more jam resistant
o two frequencies L1 and L2 give much better ionospheric delay corrections
o etc.

Ref: http://www.navcen.uscg.gov/pubs/gps/sigspec/default.htm
http://www.navcen.uscg.gov/pubs/gps/gpsuser/gpsuser.pdf

L1 C/A (that civil recreational GPS receivers use) is not suitable for the
high dynamic environments of much of the smart munitions.

The odd thing is that on their web site, clicking on the "Cool-Amp"
button or text takes you to the page for Conducto-Lube. There's no
link on their home page to the Cool-Amp information! I send them an
email message about this a few months ago, and they apparently ignored
it.

You'd think they don't really want to sell Cool-Amp?

The correct link is http://www.cool-amp.com/cool-amp.htm

Yeah, I guess you're right.

I just wish they sold Cool-Amp in bottles smaller than 1/4 pound, for
hobbyist use. A quarter-pound bottle is a bit pricy, and would
probably last me for the rest of my life and then some!

I've done it several times to FNB-4A packs. Freezing helps,
but in the newest of my packs, Yaesu used a *lot* more
glue, making it very difficult to open without slight damage.
Maybe they want to discourage replacement of the pack?

My experience with the NiMH cells is that they self-discharge
much faster than NiCd batteries. Also, it seems that they
are a bit more fussy about charging. Maxim makes several
chips specifically for NiMH batteries, and I may build up a
charger using one.

Hi, G1HSM,
Thanks for the tip. I think i'll try it out soon.... because by now the battery seems to have died completely. I haven't tryed to boost-charge the NiCd-cells yet or anything fancy, mainly because i still want to improve the capacity of the battery anyway.....

I'm replying in only one of the five newsgroups you posted to :-(~

Try Amateur Electronic Supply and Ham Radio Outlet. Those are the
biggies. They're reliable. They have web sites.

AES might have the receiver used.

Even so, I am pretty sure the IC27H is an FM only rig and an audio
filter is just not going to be that benificial to you. It may help you
somewhat with a scanner picking up AM. Where an audio filter really
helps out is picking up SSB transmissions in crowded band conditions.

C/A-code is "spread spectrum" as you call it (there is a high falootin
term that escapes me right now), just 10x narrower band than P/Y.
C/A sits dead centre on P/Y (L1) and is a few dB stronger.

Jam resistance comes from the spreading of the signal (P/Y) and the
second (L2) P/Y signal a few hundred MHz lower.
Spoof resistance is a benefit of encryption, encryption gives no "gain"
against jamming.

Further jam resistance of x dB gain comes from integrating with INS,
Doppler radar, etc.

Just posting my test results in case someone else comes searching as I
did on this meter (seem to be a lot of them out there). Anyway, bottom
line is this puppy is only good down to about 10 MHz with its
accuracy. If used lower than that I'd highly recommend re-calibrating
it for that frequency range.

Yes you are correct !

The number after the product name indicates the strength of the mix,
Deoxit 5 is a 5 % solution and 100 is 100 % full strength.

The Deoxit 5P is a pump spray can so no voc content and the ups shipping is regular
and no need for hazmat fees unless the other sprays are used.

I used the D5p on my older kenwood 520 and all the switches and pots are smooth and
no more pops or scratch sounds when using the controls. Used it also on the tube pins and
sockets.

The nice thing about jamming is, you have to put out a signal to do
it. I've seen one implementation (using phased antenna arrays) that
fairly rapidly was able to DF on a jamming source.

Has anyone tried the MFJ atomic watch they're advertizing on their web site?
Just wondering if it's much good.

Dan, W9FCC
(remove the 'No' to E-mail me)

You might want to do a search for the PDF file " 830book1.pdf ". It
has some good info, and about every mod on the planet for the TS-830
combined in one pdf.
Many I recommend highly. The VBT alignment procedure by Rick Measures
for one..
Many others...I downloaded this not too long ago, so it should still
be around. I forgot where though....The link may have been from here
on the NG. MK

Now that was real helpful wasn't it?

I have several MFJ products and have been satisfied with all of them so far. I don't have the watch but have a friend who does and he likes it. His only complaint is that he has to put it in, or near, a window on the west side of his house in order for it to receive the time signal overnight.

No problems with mine Time owned: 3 to 6 months
I've had the124 model Atomic Clock from MFJ for several months
now. While other reviews complain about no signal on the East coast, I have
never had a problem with mine not locking onto a signal. (QTH is central NC)
I also have a program on my computer that automatically syncs
when I first get on the internet, and the 124 clock always is the same as
the computers clock, down to the second.
The reason I give it a 4 instead of a 5 -- I wanted a clock to
show UTC, not local time, and although this clock will display 12/24 hour
time formats, it will not show UTC. Well, it will, until it syncs with WWV
and then it reverts to local time. If there is way for it to show UTC and
not revert to local time, the instruction leaflet does not tell how, and the
instructions leave a little to be desired. Otherwise, I have found it to be
a nice looking, very accurate clock.

friend
So So Atomic Clock Time owned: 0 to 3 months
Bought the MFJ 124 at the Dayton Hamvention. All of the display
models throughout the convention picked up the time signal no problem.
(Perhaps MFJ installed a transmitter in their storage van outside). However,
upon returning home to Kentucky, elevation of 700 feet or so, I could not
get a lock outside or inside, but I do get a sporadic signal lock, once
every 4 to 6 days at best. Thus, at least it occasionally gets a signal. In
between, the clock keeps accurate time, I have it sitting next to the
computer and have the computer synched, and the time is always correct, to
the second. So, either 1), it's getting a signal more than I realize, as I
have not noticed a quartz time shift, or 2), I get a signal once every 4 to
6 days as I theorize, and there are no quartz timeclock problems with my
unit as mentioned eariler.

Good Clock for Colorado! Time owned: more than 12 months
Here on the east coast @0200 UTC (when the clock does it's daily
lock and delta adjust) the conditions to WWVB must be non-existant. If I set
the clock for local time then 0200 EST seems to work much better. But I
bought the clock to have a UTC time piece and this defeats the purpose. When

the clok does not lock and update, the quartz? movement runs away. Up to 20 minutes fast in a 24 hour period. What a waste of money. I took the one battery out for the time and use it as a humidity and temperature display!! Maybe the antenna needs to be re designed, as what it has now is very very poor. Like the previous reviewer said "It doesn't work inside or outside."

VE3HI Rating: 0/5 Nov 13, 2001 17:31 Send this review to a friend
Crap. Time owned: 0 to 3 months
Instructions confusing at best.
Would not lock onto time signal either inside or outside of the house.
Crap. (And that's being kind)
Why do I keep punishing myself by purchasing MFJ products?

KE6PID Rating: 2/5 Jul 10, 2002 22:02 Send this review to a friend
MFJ - Once you get the knack Time owned: 6 to 12 months
The MFJ 130RC isn't too bad, but placement in your QTH is everything. The clock doesn't like my operating position where I want to use it, but works great in the living room where I don't care. It's quite accurate once "locked" to WWVB, but unlocked operation looses time quickly.

Radio Shack was selling an "atomic clock" for awhile, it had an external antenna, this thing always works if the WWVB transmitter is on but the MFJ with it's built in antenna is a mediocre performer-not locking right next to a clock that does so reliably.

To MFJ - Put an external antenna on so we can set the antenna for best signal and still see the clock and clean up the RF section, how well can that epoxy blob on the PB board work?-then you'll have a first class product. Also, it should try to sync more than once a day.

:-/

KA3POY Rating: 1/5 Jul 10, 2002 20:27 Send this review to a friend
useless Time owned: 0 to 3 months
As an impulse buy in my local ham shop, I over-rode the instinctive repulsion for low quality MFJ products and purchased this clock. The salesperson asserted that they work great.

Mine un-sets itself by several hours every evening and then correctly resets itself by morning. Humorously, the clock's brain lock occurs right in the middle of my evening operating period, around 2300 EDT.

While there may be some explanation, it hasn't presented itself after thorough readings of the instructions. I would not purchase this product again.

WA9BXE Rating: 2/5 Jun 3, 2002 18:18 Send this review to a friend
MFJ - Get your act together! Time owned: 0 to 3 months

I wanted to buy the MFJ 128 wall clock, which listens for the
time signal from WWVB, for use in my office. The primary use would be to get
my server farm operating with the correct time (and not my tech's time which
can be fast/slow or just plain wrong).

I discovered the clock I wanted (one with hands) had been
discontinued. It was replaced by the MFJ 130RC. The new digital model has
date, day, alarm and temperature, in addition to the time.

It seems to keep time OK, once you get it in synch the NBS
atomic clock.

My complaints, for the moment, are as follows:

1) The clock appeared to be used. There were plenty of scratches
on the back of the case around the mounting hole, which means it was hung
somewhere.
2) The instruction sheet was noticeably used and contains
errors.
3) The clock showed up with the batteries installed and the
packing material falling out of the box.

I was disappointed that I was sold a product that was obviously
used. If I wanted a used item, I would also expect a discounted price, which
this item was not.

I have higher expectations of this company.

This transceiver is in good working order and comes with mike, power cord, manual. Cosmetically 9/10. Some nicks on the rear corner and minor fine scratches on the top. The front panel and crystal are perfect. Nothing about the cosmetics is objectionable to most reasonable buyers. Ser#00500016.

Asking $525.00 plus shipping/insurance.

The 13V is not regulated in that radio, only the 6V. Its the regulator chip
labeled as Q4 on the regulator and calibrator board. You can also check all
the caps on the IF and AF boards. They get dried out, crack, and leak. Examine
the tops of the caps for cracks, or just replace them all.

Hi,

My FT-50 is an early model, and the battery is probably just as old.... so I hope that they haven't glued it too much...
In detail - how do you open it ? I thought about running a knife or so along the assembly edge all the way around and then try to get a screwdriver or similar inside.... is that the procedure ?

I did a bit of surfing around to find alternatives to replacing the cells..... take a look at this:

http://www.mahaenergy.com/products/radios/nimhbp/yaesu/index.htm

One question comes into my mind: These battery packs - the cells inside - are they type AA or type AAA ? -it seems to me that the slim outline of the pack might not be wide enough for a type AA cell ?

If they really are AA, it seems that I can build a new battery pack on just about the same capacity for somewhere around 2/3rd of the price, at least when I convert it into Danish currency and account for overseas shipping...
-But as you mentioned, Leon, I might need to add a new charger circuit to make really good.

I thought I responded to this earlier. sorry about that.

I have done a little work with FRS radios and find them to be pretty decent. Now the biggest problem will be when you are actually inside a building. If you are both in a building your range wont be more than maybe a mile max if you are lucky. Also these radios tend to be very loud and quite embarrassing if you are somewhere quiet. You could try maybe a CB radio and set up a base station with a good antenna and take a walkie talkie out with you, but all the special features wont be on there like pl tones or FM quality audio. I just picked up a cheap confirm FRS this weekend for literally $10 with a $10 mail in rebate to equal = $0.00 minus the stamp and tax and time. Maybe find a store that would be willing to let you take them back if they don't work. I did have very good luck with these radios for up to 4 miles or so using my ham rig as a receiver so give it a shot.

Once frozen, just a sharp rap on the kitchen counter/workbench will open
them. The cells are 2/3 AA cells, oddball size.. but readily available.

Does anyone know what stops me taking a 25m dish, pointing it at a
GPS satellite, and directly reading off the military code?

o Right-circular polarization
o Track the satellite with your dish (tracking rate is variable)
o You will need the decryption (current) code
o Don't forget you will need a correlation receiver the equivalent of a
military GPS receiver.

Reminder of current and planned signals

L5 L2 L1
------------+-------+---------------------------------------+---------
1176.45 1227.60 1575.42 MHz
115 x 120 x 154 x 10.23 MHz
| | |
| | |
Current | | C/A
Signals | P(Y) P(Y)
Proposed P-like C/A(Possibly P-like code) C/A
New Signal code P(Y) P(Y)
Structure M-Codes M-Codes

See: Sept. 2000 issue of "GPS World", "The New L5 Civil GPS Signal" by
A.J. Van Dierendonck (AJ Systems/GPS Silicon Valley and Chris Hegarty
of the Mitre Corporation.

"Conclusion
The design of the future civil GPS signal at L5 is complete. Designed
by the members of RTCA Special Committee SC-159 Working Group 1,
contributors from the civil GPS user community also helped. By GPS
standards, this new L5 signal is robust and satisfies aviation user
requirements as well as other special requirements for RTK users.
Higher received power levels allow the signal to coexist in an
Aeronautical Radio Navigation Services band with signals transmitted
by other systems. Wide bandwidth allocation along with 10.23 MHz code
chipping rate provide accuracy comparable to the GPS P(Y) code
accuracy. Longer codes improve auto- and cross-correlation properties.

A coherent carrier component provides for more robust carrier-phase tracking and a whole-cycle ambiguity resolution capability. Finally, a more efficient data message structure, combined with FEC encoding and strong CRC parity checking, provides navigational data with integrity in a more timely manner. All of these features improve interference mitigation. The new L5 signal will make GPS an even more powerful utility, serving the needs of the civil GPS user well into the twenty-first century".

Note that the military and other authorized users have access to the Y-code at the chip rate of 10.23 Mbps. Course Acquistion (C/A) is at a chip rate of 1.023 Mbps. Since the unknown Y-code is identical on both L1 and L2, several technigues can be used to extract the 10.23 MHz carrier information, which is used in high accuracy differential receivers (surveying).

Technique SNR loss**

Squaring -30 dB
Cross correlation -27 dB
Code correlation plus squaring -17 dB
Z-Tracking (reported by Ashjaee and Lorenze 1992) -14 dB

Yes, but actually it is biphase keyed with one of 32 or so different
PRN codes with a chip rate of 1.023Mbps. The P code is sent at
10.23Mbps, same modulation scheme, just 10x chip rate. The additional
spreading gain also makes it more resistant to jamming.

>

Yes, what you receive is the P(Y) code, which is encrypted, to get the
P code you need inverse Y which is what the military have in their
PLGRs and you don't have. It's a fairly long key length, so it would
take significant computing power to determine.

I have a very nice Heathkit HA-14 HF Amplifier with Heathkit HP-24 AC Power Supply. This is the small version of the SB-200 with outboard power supply. It has almost new Cetron 572Bs, all original power cables and manuals for the amp and ps. The amp and ps are in very good condition cosmetically and both work fine. Price is $525 plus shipping from 79602 Thanks, Charlie Hugg, K5MBX

>Just wondering if it's much good.

It's the kind of thing that either works or it doesn't. If it gets the
wwv signal, it works.

I seriously doubt that the folks in Mississippi actually built the
watch. They probably just put their logo on it. So quality should be
okay.

For Sale: A Radio Shack 25 amp switching power supply in MINT
condition. Only used a few months. Went "solar" with one of my set-ups
so I don't want/need it. I do believe these are mfg'ed by SAMLEX and
RS puts their own name/model # on them.

Nice quiet fan. No meter. Output's on back. Illuminated red switch.
Flat black color. Very nice.

$75 and I'll pay the shipping and postal insurance.

First e-mail or phone call gets it!

I have for sale a mint Yaesu VR-500 wide band receiver with accessories. This radio was bought at Christmas and has been only used indoors for not more than 1 hour total. This is an excellent all mode wide band receiver. It covers 0.1-1299.99995 and has 1000 memories. I am including the Yaesu CS-72 soft case, never used Yaesu FNB59 rechargable battery and the Yaesu never used NC-60B charger. This radio was only used on disposable AA batteries. I am the original non smoking owner and have all of the boxes, paper work and warranty card. This radio is absolutely perfect. I am asking $225.00 plus shipping from 48026.

Hello,

What's the max tx-power on FM-mode and SSB-mode with a Kenwood 430 ?
Is it possible to adjust FMpower ? With the carrierknob or are there other possibillies to adjust ? Has the 430 an internal antennatuner ?

3147. Re: new NiMh cells in FT-50 Battery FNB41... experiences, anyone??

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-27 19:31:28 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <v86kcg431ghoe0@corp.supernews.com>
Source record: 31879
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I don't think I've seen anyone here mention the differences in charging requirements for NiCd and NiMH batteries. The chief difference is that NiCds can tolerate relatively long periods of overcharge, provided that the current is limited to about C/10 (e.g., 80 mA for an 800 mAh cell). While it's not good practice to leave them charging indefinitely, they aren't appreciably harmed by overcharge for fairly long periods. This makes NiCd cells convenient for appliances like, say, a battery operated vacuum cleaner, where a very simple and inexpensive charger can be plugged in for extended periods without worry about the battery's state of charge.

NiMH cells don't have this tolerance. Overcharging NiMH cells shortens their life considerably. In my one encounter with engineers from a manufacturer, the exact amount of life reduction wasn't clear -- apparently it depends a lot on the overcharge regimen. But all manufacturers of NiMH cells specifically recommend against overcharging them. If your rig comes with a simple-minded charger with no overcharge control, you're likely to see shortened battery life if you consistently allow the batteries to overcharge. Ideally, you should use a modern charger which detects when the battery reaches full charge, then terminates or drops back to a very low trickle charge rate (C/30 to C/50). Many brands and varieties are available now -- the ones made by Maha can accommodate the varying number of cells you'll find in HT battery packs, and I'm sure others have this capability.

My own experience with self discharge seems to agree with what the manufacturers say -- it's approximately the same as for NiCds. You can find good detailed information at the manufacturers' web sites.

Oh, one other difference is that in general, NiCds retain their capacity better than NiMHs at extremely high discharge rates. This would probably include the current consumed by an HT when transmitting at maximum power. However, people I've talked to who've used NiMH batteries in an HT tell me that the increased nominal capacity of the NiMH cells more than makes up the difference. Even if you might not get quite a proportional advantage when transmitting, you still come out ahead. And you should get the full capacity difference advantage when receiving, which is where most HTs spend most of their time.

Some answers to questions you might have...

1- The battery is original and has very little use. I purchased the H/T more for listening than transmitting. It is a BP-173, 9.6v and 650mAh.

2- The radio has never failed and I guarentee it to NOT be DOA.

3- The radio has been babied, it has never been dropped and never in a smoking environment.

4- The radio serial # is 14684. It is in as new condition and, with the exception of clear packing tape over the display lens, there are no marks/dents or scratches on the radio.

The radio will be shipped in the original box with the original manual, quick reference card, wall charger, stock duck antenna and wrist strap.

5- I am selling the radio to help defray the cost of a Kenwood TH-D7A(G) I just purchased.

6- I don't have access to a digital camera, I cannot provide photo's.

Although I haven't sold many things, I have a good eBay rating (see NPDXO) .

$190.00 + shipping from 11786

When you order from R&L, make sure they're shipping from stock.
Otherwise, forget it.

I've shopped at R&L a lot since moving to Cincinnati from 2-land. I
love visiting the store, I've bought many thousands of dollars of stuff
there, and I've always found the store folks to be courteous and
helpful.

But three times I've had to wait for back-ordered items that the store
didn't have in stock. And I waited, and waited, and waited ....
Several months the first two times. I gave up after one month the third
time. In each of the three cases, when I contacted the supplier (Rohn,
Icom, M-squared) directly, they expressed surprise that I had been
waiting so long, and they shipped the item to me the next day. R&L
should be performing this kind of follow-up, but they don't.

Leigh

I bought a CSM-50A on eBay a few years back because it had
the tracking generator and spectrum analyzer options;
but I use an IFR at work.

Nice units, but the question is what is your use for one?
Unless it is going to be a money maker, as others noted they are
difficult to fix, and as one monitor repair shop told me "there is
nothing inexpensive" in them when they break!! So far I've been
able to fix the problems in my unit, but when the day comes the
YIG oscillator quits, it may be a parts unit back on eBay.

Most of the Cushman stuff is getting a bit dated. Sometimes
I think buying the functions as separate pieces of test gear
makes more sense, unless size is an issue.

Source record: 31894

I have for sale my trusty ICOM IC-735 HF transceiver, selling due to long term travel overseas and so I want to downsize my radio posessions. The IC-735 is one of ICOM's most successful and reliable HF transceivers, with a respected hot receiver, all the features you need and a great signal. This unit has been used mobile once in a while, but that is a feature not a negative, because you can be assured this radio works under all conditions. It does work perfectly and includes the front plastic door. As a bonus this radio has the following options:

1) 250Hz CW filter
2) inbuilt CW keyer option
3) a full SERVICE manual
4) mod for full transmit

Besides the options it comes complete with microphone, mobile mount, DC power cord, manual.

This radio is in good cosmetic condition. It is a great radio...you will be happy with it.

My asking price is USD $400, plus you pay shipping via your carrier of choice.

From: W7RBR <rbriver@attbi.com>
Message-ID: <oRQga.258095$qi4.145336@rwcrnsc54>
Source record: 31798

* ICOM IC-735 HF transceiver in very good condition
* HM-12 Hand Microphone with up/down switch
* Power Cable
* Instruction Manual
* FL-32A 9.0106 mHz (500 hz) CW filter installed
* EX-243 Keyer module installed

$395.00 plus shipping from 97006
Or possible trade for SGC-2020 QRP rig.

Thanks,
Rick
W7RBR

WTB shaft adapters, both 1/4" & 3/8", all metal, with two set screws each side.

Need 3/8" shaft inside to 1/4" solid shaft outside; Need 3/8" shaft inside to 3/8" shaft inside;
Need 1/4" shaft inside to 1/4" shaft inside.

These adapters will probably be no longer than 1.5" overall.

The atas-120 is supposed to operate on HF/V/uhf bands , Has anyone operated this way . What performance have you received especially on VHF/UHF band operation . One antenna 2 port radio . Did you use a duplexer, and what make or model . How does the control signal get to the atas120 through a duplexer?
thanks,
Bill

No internal tuner, max out is 100w, FM power NOT adjustable without a
mod,
and when in FM, rig runs full-blas6t, so watch those finals!! There is a
mod
to have variable output all-modes, entails a 9v batt and the acc socket
on the
back...www.mods.dk
other than that, darn good rig!!
cheers,
JJ

From: Jim Wagner <nospam@fromanywhere.net>
Message-ID: <3E84A4F6.30107@fromanywhere.net>
Source record: 31822

The best thing to do is start with a schematic of the rig. You didn't specify which particular model of the FT-101 you had, but I'll try to help. If you don't have a schematic, pull one from this link:

http://hamradio.online.ru/ftp2/man_sch_ft101.pdf

Check and be sure you have the heater switch on the front panel in the correct position. That would definitely cause the problem you are describing. If it's in the right position and hasn't failed itself then -

From the schematic, the filaments on your PA tubes are in series, so a failed tube filament would cause both tubes to not light up. Since you indicate that there's no heater voltage on the 12BY7A, then I'd suspect something else. You can pull the tubes and use an ohm meter to check filament continuity easily, though.

1. Look at the voltage on pin 2 of J14, the ACC socket. You should read 12.6 vac. If you do then check pin 4 on the 12BY7A. It should read the same. If you have that voltage in both those places then you either have an open filament on that tube or a bad socket. If you read 0 vac on J14, then check pin 9 of J9 for 12.6 vac. If you don't see it there, then follow the wiring back to the main power transformer and check it there. If you follow it all the way back to the transformer without finding 12.6 vac then either the transformer has failed or you've likely got a blown fuse, F1.

2. You didn't say whether or not you had any receive functionality. If the receiver is dead I'd bet on the blown fuse. If the receiver is working and only the tubes aren't lighting up then I suspect either a failed winding on the transformer or a bad connection between the 12.6 vac transformer tap and the filaments.

3. One other possibility, if it was just the PA tubes not lighting up. From the schematic I'm guessing there's suppose to be a dummy plug on the ACC socket that has a wire shorting pins 1 and 2 to route heater voltage to the PA's. I didn't see anything about such a plug in the manual and I don't have one of those rigs myself, so I might be wrong on that. (An old Henry Radio Tempo One I owned from the same time period used a plug like that.)

From the schematic it looks like a pretty simple, straightforward filament circuit, so just follow the road map and be careful where you stick your fingers.

If there's anything you don't understand about what I've said, I'd strongly suggest you take the radio to a repair shop and

let them look at it. There are some pretty dangerous voltages
floating around in that rig and you don't want to get across
them.

Good luck and 73 de Jim, N4SVZ

> Encryption?

The P(Y) signal is a mangled version of the P signal. The P signal can be constructed easily from received C/A data -- read the GPS ICD. If you had a 25m dish, you may (insert link budget analysis here) be able to read the P(Y) bit stream directly. This would provide you with a _most_ useful start point for cryptanalysis: corresponding plaintext and ciphertext.

Presumably the crypto is resistant to such an attack, but recall that this is 1980-ish technology: what was felt to be an adequate key length/crypto-system then may well be vulnerable today. In the attackers favour is that stream ciphers -- of which the Y code almost certainly is -- are, comparitively, the weakest class of ciphers we know of. Against the attacker is the exact structure of the cipher is not known. But then, how many military receivers have now been lost in action, stolen, or otherwise delivered into the hands of a capable analyst? The Y-code specification (nominally secret) may well have been illicitly photocopied for cash by now. (Hansen, Pollard, etc).

But, in fact, it is still "an adequate key", i.e., unbreakable with
computer technology.

In the

>KD4PQF

The correct tubes are 6JS6 in the finals and 12BY7 for the driver. The book says that the 6LF6 is a substitute, but I don't think it will sub in an FT-101 without modification. If the rig hasn't been modified, I'd get a good set of 6JS6s and install them. Check the small cap in series with the tunable neutralization cap. Make sure its about 10 to 12 pF @ 1KV mylar block if you are using anything except original Toshiba finals.

The filiment connection runs through the accessory plug in the back of the unit. If the plug is missing, or if someone has stuck just a plug in the socket without jumping the connections for the filiment, the tubes won't light.

Let me know if you need more help.

73,
Scott M.

COMPREHENSIVE COMMUNICATIONS CONSULTANTS

OFFER TO SELL - PRICE REDUCTION

Comprehensive Communications Consultants (CCC) is acting as the sole agent for the owner in the sale of the following lot of used UHF mobile radios.

Although the equipment was operating satisfactorily when recently removed from service, as it is used electronic equipment, it is being sold "as is" with no warranties expressed or implied. No returns accepted.

The lot is being offered first as a "total lot" sale. We will only sell individual units or groups of units if the total lot is not sold in a reasonable amount of time at a price satisfactory to the owner.

All units include microphone. No power cords or brackets are included. However, we can provide power cords and/or new "universal" (not original equipment) brackets at a nominal extra cost.

We accept all credit cards, money orders or checks from existing customers. All other checks will be held for clearing before shipment is released. Terms are payment with order, FOB Garrisonville, Virginia. Shipping is not included in the listed price.

The lot consists of the following:

40 each Motorola CDM 1550LS (AAM25SHF9DP5AN) - approx. 6-12 months old.

29 each Motorola Radius SM120 (M44DGC20C2AA), 4 channel - approx. 4 years old.

11 each Midland 70-1526B, 25 watt 8 channel - very good condition with all accessories, boxed-light usage.

8 each Midland 70-1526B, approximately 8 years old.

6 each Motorola Maxtrac (D34MJA77A3CK), age unknown

Total price (plus shipping from Northern Virginia) $15,000 USD OBO

When these units are sold, there will be an additional 70+ Motorola CDM 1550 LS units for sale. These will be offered first on a "first option" to the buyer of the lot listed above.

Please email (chemely@cbc.org) or fax (+540.752.9300) offer.

It's been a long long time, but when I was toying with self-guided munitions for our rich uncle their antennae were broadly directional. The antenna got oriented toward the satellites before or soon after launch. Thus a ground based jammer would have to overcome the antenna's null whilst an airborne one wouldn't last long - this of course in addition to the previously mentioned encryption, etc.

Then there is the problem all jammers face best illustrated by the Brit's in their war with Argentina when a Frigate successfully diverted an incoming missile around itself and onto a troopship it was protecting! Luckly the troopship had already unloaded but the point was not lost on our rich uncle, who put more $$ into Aegis and less into EW thereafter.

Similarly, a GPS jammer in Iraq might divert a bomb from himself onto the school where his children were sheltering.

3196. Does Kenwood equipment ever go on sale?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-29 07:22:49 UTC
From: fj40dana@hotmail.com
Message-ID: <9a118507.0303282322.1a596a9a@posting.google.com>
Source record: 31828

I'm interested in the tri-band HT, model TH-F6A, and it's currently around $325 at the various vendors. I compare this unit to the Yaesu VX-5R which is about $120 less, due to a pricing "adjustment" from Yaesu.

Does Kenwood ever have these kinds of factory discount sales?

thanks

Dana

I have for sale a mint Yaesu VR-500 wide band receiver with accessories. This radio was bought at Christmas and has been only used indoors for not more than 1 hour total. This is an excellent all mode wide band receiver. It covers 0.1-1299.99995 and has 1000 memories. I am including the Yaesu CS-72 soft case, never used Yaesu FNB59 rechargable battery and the Yaesu never used NC-60B charger. This radio was only used on disposable AA batteries. I am the original non smoking owner and have all of the boxes, paper work and warranty card. I am asking $225.00 plus shipping from 48026.

Try Grove (grove-ent.com) or Universal. They have the same prices,
Grove is a little more personal in terms of service but the prices
match. I've ordered from both The free DSP coupons say for USA only,
but they will send to Canada if the R75 was bought in the USA and sent
to Cda. For Canada, get them to ship by postal service not a courier
service to avoid 30 or 40 bucks of customs brokerage (you may have to
insist on this depending on who you talk to when ordering. The delivery
charge is not much different, post is slower, but only by a day or two.
I get things in about 5 work days).

Radio equipment is duty free to Cda in all situations. You will get a
GST bill about 1/2 the time if the originating company doesn't have an
account. This is payable on delivery most of the time. Canadian price
has dropped 200 to 1199 or so, but this is still more than the USA
discounted price, the Cdn dollar is a little stronger lately, and you
don't get the give aways. The filter prices compare for Cda and US.

<< Most of my post adapters have removable cap-nuts that let you use ring connectors. The ones on my Radio Shack power supply are captive and I can't tell where the locking has been done. >>

Ken-

I tried unscrewing the caps on my Radio Shack 25 Amp Switching supply, but the plastic came loose from the knurled nuts. The flared end was just too strong!

An alternative would be to replace the Banana Jack assembly with bolts the same size as the internal threaded part, so the existing insulators could be used. My problem doing that, is that I'm trying to convert to Anderson Powerpole connectors using a "Rigrunner". The supplied power cable has 1/4 inch ring terminals. I don't think 1/4 inch bolts would fit the Radio Shack power supply without surgery.

Ken, KO6NO, suggested cutting a notch out of the ring terminals. I think that would be a good idea for the 1/4 inch terminals used on Banana Jack binding posts. One should be able to bend the notched ring so its ends overlap, making it like a ring of smaller diameter. With proper overlap (clockwise vs. CCW), the binding post would tighten so the ring will not come undone.

Hi all, I had this amp on ebay and after one day they killed the auction. Seems they don't allow ANY amps that can tune from 24 to 35 MHz. So now it's here...
It is for the 10 meter ham band only, it is illegal to transmit with this amp
on 11 meters but you can use the receive preamp there!!! It works off a 12 volt power supply or it will work in your car also. It has a low power / high power
switch with a high power LED, RF LED (lights when in transmit) and a receive preamp switch with a receive amp LED indicator. The receive preamp works very well pulling in those weak signals on the fringe. The transmitter amp works
very well also. It is excellent condition. Not much more to say about it other than it is in perfect working and looking order. Will NOT be DOA!!

Source record: 31841

Got an Alpha 78 yesterday and it works fine on 15-20- but has a 2.5 to 1 SWR missmatch between the radio the amp on 40 meters and 5 to 1 missmatch between the radio and Amp on 75 meters. I changed Coax, my antenna is a 1.3 to 1 swr without the amp on, changed amps and the other amp works great. Is there a tuned input on the alpha 78? Could the bandswitch be dirty? Any sugestions?

Whenever _anyone_ juxtaposes the words "unbreakable" and "cipher", the
probability that one is dealing with a purveyor of snake-oil (or is
just plain ignorant of the facts) gets disturbingly close to 1.

Yawn. A5 is a stream cipher that protects millions of GSM phone calls
every day. The key is changed _EVERY CALL_. It was, in fact, a
fairly strong stream cipher designed in the 1980's.

Current technology cracks it in less than a second. See:

http://cryptome.org/a51-crack.htm

amoung many others. As I said, openly published cryptanalytic
experience is that stream ciphers are substantially weaker than
equally-sized (e.g., key bits) block ciphers, sometimes shockingly
weaker. See Bruce Schneier's "Applied Cryptography" and other texts
for numerous examples, and reasons why this is the case.

Now, can you offer any publicly accessible material to back up your
claims of security ("unbreakable by computer technology") for the
Y-code? Or am I just to take it on your word that you have seen the
relevant (and secret) ICD's, conducted your own analysis, and be
impressed by your ability to keep a State Secret?

3213. Need Help with Signal / One CX7A Power Connector

I have a Signal/One CX7A without a power cord. I recently purchased the proper connector, and went to my user's manual to look at the schematic / pictorials on how it's wired ..... NO SCHEMATIC!

The wiring to the connector on the inside of the rig is fairly difficult to get to to see what goes where.....

Does anyone know how to wire the Cinch-type power connector (for 110 volt operation)?

Please reply direct to w8kzw@arrl.net. Graphics / jpg's are especially appreciated!!

Thanks,
Jeff

<< Most of my post adapters have removable cap-nuts that let you use ring connectors. The ones on my Radio Shack power supply are captive and I can't tell where the locking has been done. >>

Ken-

After posting the first response, I went back and took another look at the Banana Jack assembly. I twisted off the plastic covers, screwed in the knurled nuts and used a Dremel Moto-Tool cut-off disk to remove the flare.

I suppose it might have been possible to disassemble the assembly, and screw the nuts all the way to the other end. That way the flare could have been removed without damaging the plastic nut. I didn't think of that in time! Also, the plastic might have been removed just by pulling on it without twisting, as the "knurl" consists of longitudinal slits in the surface of the nut. After twisting them off a couple of times, they tend to slip when they get tight.

It turns out that the resulting terminal just fits a 1/4 inch ring terminal. I added a lock washer on top of that, screwed the knurled nut down and pressed the plastic covers back in position.

I had started out planning to use a wire-to-powerpole adapter but decided that wasn't a neat way to go. When the nut loosens due to vibration or stress on the wire, a ring terminal won't fall off the stud. A bare wire can fall off, or can be easily pulled off. I worry that a loose wire might touch something and cause a short circuit.

Source record: 31750

There is a nonswitched untuned broadband input toroid transformer between the RF input and the cathodes of the 8874's. Also, are up to 15 resistors in parallel to "swamp" the input power from your transmitter so the tubes are not over driven. From the factory this resistor pad measures 14 ohms and to get full output from amp requires 120+ watts of drive. The "low drive mod" that most owners did removed this pad and replaced with a 95 ohm pad of resistors which lowered drive rquirement to 65 watts for full output. Your bandswitch is ok and has nothing to do with the input impedance. Your toroid may be bad. Open up, count resistors and measure pad to see if has mod and look at toroid condition. Should be a cheap fix. Gilbert

Thanks for taking the time.

Actually the single-banded amps ARE illegal between 24 and 35 MHZ. That's why they ended the

auction. The fed came down on them some time ago for allowing such sales. Whether ham-to hams

sales are allowed, I don't know. Let other other guys hash out this one.....

Maggie-

I can tell that you are very proud of your radio. Isn't that about what it
cost new, fifteen years ago?

As a point of interest, with a PEP capability of 30 watts, the 20 watts AM
signal can only be modulated to a maximum of 37.5 percent. It might sound
better if AM power was reduced to 7.5 watts with 100% modulation.

3233. Bird Slugs for Sale

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-30 16:52:20 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <8hFha.3271$rN3.290982@newsread2.prod.itd.earthlink.net>
Source record: 31766

Hi all,
I have some extra slugs for the Bird 43 wattmeter.
These are duplicates of what I now own.
If you need any slugs, I may have a spare.
Let me know what you need.
Best Regards, Frank KG9H

3234. Yaesu FT-50R package 4-Sale

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-30 17:32:49 UTC
From: "Rodger N. Bird" <rbird2@peoplepc.com>
Message-ID: <MPG.18f0f44c3ce5fdd69896de@trialnews.peoplepc.com>
Source record: 31767

I have a complete Yaesu FT-50R package For Sale. Asking $200.00 for the following items (AES pricing shown below):

FT-50R Dual Band HT
FNB-40 Ni-Cd Battery Pack (6V 650 mAh)

$14.99 NC-60B Ni-Cd Battery Charger
$19.99 FBA-15 Battery Case ("AA" size)
$26.99 E-DC-5B Cigarette Lighter Cord with Noise Filter
$21.99 SPM-100 Premier Speaker Mike
$10.99 CT-30 Microphone "Y" Adapter
$39.99 ADMS-1C Software and Cable (FT-11/41/51R , FT-10/40/50R)
$58.99 FNB-41H Ni-MH replacement battery pack (9.6V 1000 mAh)-Kendoo
$58.99 FNB-41H Ni-MH replacement battery pack (9.6V 1000 mAh)-Kendoo
$59.99 MH-C888 MAHA Rapid Charger & Conditioner
$7.99 MHS-C801 MAHA Charging Cup for MH-C888 Charger

$320.90 Total Accessories

The Yaesu FT-50R operates with no problems, is in good condition, and the batteries are good (Kendoo batteries are new). The MARS wideband TX modification has been performed. I have the original boxes for the HT and most accessories. The selling price of $200.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. Do not reply to this message.
My email address is: rbird2@peoplepc.com

Thank you,

Rodger

3235. Panasonic RF-B11 4 Sale.

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-30 17:37:30 UTC
From: "Rodger N. Bird" <rbird2@peoplepc.com>
Message-ID: <MPG.18f0f5634a6e075f9896e1@trialnews.peoplepc.com>
Source record: 31768

I have a Panasonic RF-B11 4 Sale.

Panasonic RF-B11 Information:
FM/LW/MW/SW 12-Band Receiver.
9 shortwave bands.
3" Dynamic Speaker for outstanding sound.
FM Stereo with Optional Stereo Headphones.
DC-in Jack.
AC Operation with Optional AC Adaptor.
Tone Switch (high/low).
LED Tuning Indicator.
LED FM Stereo Indicator.
Stylish Design.
Band Indicators.
Stand and Hand Strap Included.
Batteries 2 x AA

The Panasonic RF-B11 is like new and in excellent condition. No modifications have been done to it.

The selling price of $35.00 includes shipping and insurance costs within the continental United States via the U.S. POSTAL Service. Payment with a

U.S. POSTAL Service MONEY ORDER is preferred.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

3236. Uniden Bearcat 200XLT Scanner 4-Sale

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-30 17:42:22 UTC
From: "Rodger N. Bird" <rbird2@peoplepc.com>
Message-ID: <MPG.18f0f6863451060f9896eb@trialnews.peoplepc.com>
Source record: 31769

I have a Uniden Bearcat 200XLT handheld scanner (with cellular coverage) for sale. A few features listed below:

Channels 200, Banks 10
Coverage 29-54 118-174 406-512 806-956 MHz
Priority 10 channels, Delay, Lockout, Keypad Lock
Instant Weather
Display Light
Power: 12 volts
Size: 2.75(W) x 1.25(D) x 7.5(H) inches
Weight: 20 ounces

I have the antenna, case, 2 BP-200 rechargeable battery packs, wall charger/adapter, car charger.adapter, and a copy of the manual. I do not have the original box or original owners manual.

The 200XLT is in fair condition and works fine. Both batteries are good and hold a charge, one of the BP-200 batteries is brand new. There are some scratches on the case and display. The selling price of $80.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

3237. BayGen Freeplay 360 AM/FM Self Powered Radio 4 sale.

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-30 17:43:04 UTC
From: "Rodger N. Bird" <rbird2@peoplepc.com>
Message-ID: <MPG.18f0f6b46728f8289896ee@trialnews.peoplepc.com>
Source record: 31770

I have a BayGen Freeplay 360 AM/FM Self Powered Radio 4 sale. This is a self power
radio and will run on the following power Sources:

Internal - B-Motor textured carbon spring driving a DC generator through a transmission.

Solar - High performance thin film solar panel

External - Optional DC adapter (center pin positive) 4.5 V 150mA (minimum)

The Frequency Range is:

FM - 88 to 108 MHz

AM - 520 to 1700 KHz

For more information see the following web pages:

http://windupradio.com/freeplay3.htm

http://www.ogormans.co.uk/freeplay360.htm

http://www.productsforanywhere.com/gear/details/fp_360.html

The Freeplay 360 is in excellent condition and works fine. The selling price of $30.00 includes shipping costs within the continental United States.

Please email me direct if you are interested. Do not reply to this message. My email address is: rbird2@peoplepc.com

Thank you,

Rodger

You might sell it faster if you advertised in a group intended
for buying and selling. This one's for discussing amateur radio
equipment. Not only are you advertising, but you are advertising
something that is not directly applicable to ham radio.

This is your third post for this radio in a year, which should
be an indication that you haven't found the right venue. Try
rec.radio.swap or maybe even more novel, your local buy and
sell newsgroup, where someone local can buy it and no shipping
(or packaging for that shipping) is required.

Greetings:

Everyone knows that the condition of radio equipment has a profound affect on its assessed value. As more radio equipment is traded over the Internet, greater reliance on condition descriptions is needed. The primary purpose of the Universal Radio Equipment Grading Standards (UREGS) is to help pin down a reliable grade, representing the true condition of equipment.

The UREGS are now available in both a shorter, easy to use form as well as a revised longer form on the www.UREGS.org web site.

The UREGS provide a suitable means of describing the condition of ANY radio equipment.

Traders are encouraged to check the new site and to use UREGS standards for grading manufactured or homebrew equipment.

You may also use the new web site to directly access the UREGS Team, regarding questions, suggestions, or to volunteer to help with the project in the future.

If you think of ways to make UREGS better, tell us!

Cheers,

The UREGS Team

Sam Wormley <swormley1@mchsi.com> wrote:

> Crack the P(Y) code and tell us how easy it was.

I've got a better idea: why don't you _prove_ your firmly made claim
that the Y-code is "not breakable by computer technology".

Can you do it?

If you can't, then you'll have to let me walk the path I outlined in
my posting, so I can fairly comment on "how easy it was". To wit,
please forward to me the following information:

a) the algorithm itself. This will simulate, as I suggested, the
theft or capture of a receiver and its reverse engineering.

b) a means that I can obtain, at any time, any amount of ciphertext
and corresponding plaintext, time-stamped with respect to the GPS
system time, and selectable by SV (or any other parameters I may
request). This will simulate the interception apparatus someone noted
-- the "25m dish" -- as well as the necessary support mechanisms.

c) I will also require test vectors and/or other documentary evidence
that is sufficient to prove that the items in (a) and (b) are, in
fact, the currently used Y-code and not just some distracting
nonsense.

To my amazement, I now believe you are in no position to satisfy
either request. You are just blustering away here, worshiping the
technology gods: you haven't a clue how strong or weak the Y-code
actually is. You just believe it is strong, and wish it to remain at
that. The "head in sand" approach to security.

Well, the Japanese felt their Purple machine was pretty strong too.
So where the Germans re: Enigma. But in the face of a determined, and
sufficiently motivated, adversary they were proved wrong. I have
outlined reasons why I believe the Y-code would _probably_ fall to an
equally motivated attack. Mind you, I seriously doubt such an
adversary exists because, despite all the "ooooh"'s and "aaahhh"'s
from the easily impressed (which now appears to include you!), the
ability to spoof a military GPS receiver just isn't that big a deal in
the grand scheme of things.

You are asking proof of a negative.
"Prove there are no white crows."

> Can you do it?

Of course not.

The contrary proof ("breakable by computer technology") is simple:
show that you have broken the code. Until broken, the code IS
unbreakable. Simple, isn't it?

3261. WTD: Manual for Icom Repeater RP2210

Newsgroup: rec.radio.amateur.equipment
Date: 2003-03-31 14:31:12 UTC
From: Mark Bramwell <icom@foxhollow.ca>
Message-ID: <QiYha.928$oA1.193363@news20.bellglobal.com>
Source record: 31793

About 10 years ago the club installed a 220 repeater. The person that installed it left for Australia 4 years ago and never came back. Somewhere in the Outback is the manual and access codes, we however are in Canada.

We found a manual for the 1.2gig version of the repeater and they seem to have the same controller. There are about 50+ switches in this thing.

Is there a PDF manual somewhere available for download? I have searched the net and haven't found anything but basic specs. Our plan is to reset the CPU and set the parameters to current club standards.

Thanks in advance for any info,

de ve3pzr.

3262. FS Heathkit HA-14 HF Amplifier

I have a very nice Heathkit HA-14 HF Amplifier with Heathkit HP-24 AC Power Supply. This is the small version of the SB-200 with outboard power supply. It has almost new Cetron 572Bs, all original power cables and manuals for the amp and ps. The amp and ps are in very good condition. Also included are 6 spare exact
replacement filter capacitors for the PS. Price is $475 plus shipping from 79602.
Pictures available upon request. Thanks, Charlie Hugg,
K5MBX

It's not, or at least this isn't evidence of it. It's programmed in the
"alter only the bits that need altering" method.

Now if you found win3.11 in 9x, or 9x in NT, that'd be evidence of c/p
programming.

Sam Wormley <swormley1@mchsi.com> wrote:

> Like I said the P(Y) code is secure...

Like I said, you are in no position at all to make a claim like this
with any authority.

> until you prove otherwise.

Furthermore, it goes the _other_ way: the code is _insecure_ until
YOU prove it secure (or at least quantify the security). This is
basic COMSEC doctrine; that you appear to be unfamiliar with it only
shows you are even more ignorant than I originally assessed.

Naturally, I don't expect the US government to be offering any proofs
of security any time soon (why should they?). However, _your_
categorical claim of security is based on pure bluster, and not facts.
I have only simply noted how collection of the essentials (ct/pt,
algorithm details) is far from impossible, and that stream ciphers are
comparitively weak, and that motivated attackers have done _MORE_ with
substantially less in the past. You are free to comment on the
feasibility of what I have mentioned, but inventing straw men (to wit:
that I claimed it would be "easy", etc) doesn't reflect well on your
otherwise excellent record.

Hi NewsReaders,
My trusty Cubic/Swan 150A just started receiving at frequencies that don't match the ham bands. It develops full power transmit, but I'm uncertain as to whether it is on frequency. I noticed earlier that at the highest microphone gain setting (= power setting) it was frequency shifting badly although the incoming power supply voltage was nomial. My meter light has always dimmed when I key down at about 100W out.
I have a service manual and have been under the hood before. I would sure appreciate any guidance as to what to do.
Thanks for reading this, Carl KB2KDV, cpf1@cornell.edu

3277. make money right now fast!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!Just give it a try

$MAKE YOURSELF SOME MONEY$$, NO SCAM! GUARANTEED MONEY! NO JOKE!$$

Dear Internet User,

Hi, I'm 23 years old and I make more money than my parents and so can you" Turn $6.00 into $60,000...read this to find out how!!! READING THIS COULD CHANGE YOUR LIFE!

I found this on a bulletin board like this one and decided to try it. A little while back, I was browsing through several newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you need to send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are millions) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, why it works.... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!

SUGGESTION: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue it’s success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a

service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

~~~>HERE ARE 4 EASY STEPS TO GET STARTED<~~~

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (Please make sure that the bill wouldn't be noticed in the envelope to prevent thievery). Send out US $ DOLLAR, so it would be more acceptable.

STEP 2: Next, place one paper in each of the 6 envelopes and seal them properly. You should now have 6 sealed envelopes, each with a piece of paper stating the phrase, "PLEASE PUT ME ON YOUR MAILING LIST.", your name and address, and a $1.00 bill.

What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting for a legitimate service and you are paying for it! Like most of us, I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!

Mail the 6 envelopes to the following addresses below:

#1)B. Hooper ; 3 Warringah Gve.
Petrie, QLD, Australia 4502

#2)Matthew Speight ; 6 Charnwood Ave.
Belfast , N. Ireland : BT15 5DH

#3)Ahmad Mujeeb ; 307-14 15 st, NW,
Charlottesville, VA, USA, 22903

#4)Rostum Hernandez ; #2 Jericho St.,
Victoriaville Subd. ,Antipolo City,
Phillippine, 1870

#5)R.Pena ; 1962 46St. S.W.,
Naples , FL., USA, 34116

#6)sara siemon
9245 lower valley pike
new carlisle,oh 45344

STEP 3: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.

STEP 4: Copy this article. Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 2.4million groups) All you
~~~

need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18, Section 1302 and 1341, US Postal and Lottery Laws or Title 18, Section 3005 in the US code, also in the code of Federal regulations, Volume 16, Sections 255 and 436, which states; "a product or service must be exchanged for money received." The simple note in the letter, "PLEASE PUT ME ON YOUR MAILING LIST", makes it legal because you are paying for exchange of a service, (adding the purchasers name to his mailing list) for a $1.00 fee.
: Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!

~~~>DIRECTIONS FOR HOW TO POST TO NEWSGROUPS<~~

Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your mouse cursor at the beginning of this letter, click and drag your cursor to the bottom of this document, right click and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.

Step 2) Open a blank 'notepad' file and place your mouse cursor at the top of the blank page. Right click and from the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name and postal address to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)You can post anywhere!!! There are tons of free bulletin boards if you just look for them!!

Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the "post" message button. You're done with your first one!
NOTE: Please don't SPAM or send unsolicited emails. It's completely illegal.
~~~

Send emails to all the people you know or any ways that allows you to, instead of SPAMMING.(Just a reminder).

Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about a minute for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

*Now the WHY part; Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still ONLY 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet!!! REMEMBER, PLAY FAIRLY AND HONESTLY AND THIS WILL WORK FOR YOU!!!

I'm not going to trying to prove anything one way or another... but I
would like to point out that I worked with encryption tasked by DIRNSA
while in the service for three years (Berlin), followed by a masters
degree concentrating on information theory and encryption, and have
kept abreast of the field for several decades... however, as I said,
that doesn't "prove" anything.

Spring cleaning - SHACK SALE!

March 31, 2003

ORIGINAL POST - Watch For Updates & Additions

*** Communication Specialists TP-154 Repeater Controller ***

Encodes / Decodes PL, DPL and I think inverted PL

Has a courtesy tone

Has an ID'er

Programmable time limits for system and for each tone/code

Lots of other features

Manual with programming, operation and hook up data included

Programmable over the air or via programming jack - uses a touchtone phone.

A great controller for starter / basic systems

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-027S.JPG

*** Asking $165 Shipped - OR OFFER ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Radio Shack PRO-2067 Base / Mobile Scanner ***

500 Channels
Trunk Tracking - Motorola type I, II. I/II Hybrid, LTR, EDACS
SAME Technology for Weather alerting
PC Programmable
Direct keypad frequency input
CTCSS / DPL decode
4 line Alpha display
BNC antenna connector
Plus much much more features

*** Comes with the following: ***
Mounting bracket
Original user manual
Wall wart power pack - for base use
Serial programming cable

Programming software

This scanner has been tested and works just beautifully. Condition is Very good - non-smoker, never mobile. I bought 2 of them, I just need one now... so
one has to go.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-018S.JPG

*** I'm asking $180 Shipped - OR OFFER for the whole setup ready to plug and play... sent 2-3 day priority mail ***

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Motorola P200 UHF 2 Channel Handheld Radio***

Only problem .. the antenna has some shrink tubing on it because the plastic on the antenna is cracking.

Has been tested - is in good working condition

Physical condition is VERY GOOD with exception to the antenna.

Battery condition is EXCELLENT!

Currently programmed in the 460Mhz area

Easily converts to 6 channel

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-019S.JPG

*** Asking $60.00 or offer - shipped ***

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Palm IIIx PDA ***

Just your basic Palm PDA

WORKS GREAT!

Maybe it could find a use on APRS or used with a GPS unit.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-021S.JPG

*** $40.00 shipped - or offer ***

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Kenwood TM-742A Multi Bander Mobile Radio ***

This radio has a problem. I only can get a little blip of the backlight when the power button is pressed. I have not worked on it, I just do not have the time and I do not have a service manual .so I have no clue what the problem is.

Comes with a Kenwood DTMF mic, 2M module and 440 module.

These radios typically go for over $500 when working

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-023S.JPG

*** Asking $250 shipped - or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Kenwood TS-700SP 2 Meter ALL MODE ***

Built in digital display along with analog dial

10W output - perfect for feeding amplifiers

Comes with the 120V AC cord, manual and the original hand mic.

Works good, however the display flickers once in a while when tuning.
Rocking the tuning dial up and down in freqs clears the problem.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-024S.JPG

*** Asking $150.00 Shipped - Or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Scott Air Pack SCBA unit (Fire Fighters air pack) ***

Comes with carry / storage case, mask, regulator, tank frame and tank . the whole complete unit.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-025S.JPG

*** Asking $135.00 Shipped or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Setcom 7-PR4SB Headset with Boom Mic ***

I'm not sure what radio it is wired for, but it was used with an HT for auto racing (Pit Crew)

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-030S.JPG

*** Asking $45.00 shipped or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** TX-RX 900MHz Vari-Notch Cavity filters / (Duplexer?) ***

Quantity - 4

Filter Type - Vari-Notch

Model - 15-88-01

Freq - 890 - 960MHz

There is 4 of these filters on a rack mount frame. No interconnecting cables. I was going to send these to TX-RX to have them convert 2 of them to Pass High and make the interconnecting cables - But I went with a different duplexer.

PICTURES AT:

http://www.kmcnet.net/Auction_Stuff/MVC-028S.JPG

http://www.kmcnet.net/Auction_Stuff/MVC-029S.JPG

*** Asking $175 shipped - or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

There's more to be listed... Keep an eye open for my posts.

I accept Paypal online payments, US Postal Money Orders and TRADES. I don't have any specific list of what I'm looking for in trade.so if you want to offer a trade, send me your "trade list" for what item(s).

Please note, included shipping is for continental US addresses ONLY, Hawaii, Alaska and international addresses, I will calculate the additional shipping needed.

Thanks

Dave Schmidt

Um ... he did not ask for anyone to prove a negative.

A code is secure until it is cracked, which was my whole point,
which you failed to quote.

Here it is again, just in case you wish to address what I said:

You are asking proof of a negative.
"Prove there are no white crows."

> Can you do it?

Of course not.

The contrary proof ("breakable by computer technology") is simple:
show that you have broken the code. Until broken, the code IS
unbreakable. Simple, isn't it?

I can't proove it, but I did see a white crow myself about 3 weeks ago in the Albertson Parking lot here in Oregon. It was with a bunch of other crows, picking up stuff off the parking lot (I think some one dropped a hamburger). I tried to take a picture to show my wife, but the only camera I had on hand was my Casio Watch camera, and combined with my walking up closer, and him walking away from me, it came out real blurry.

The UHF GP-68 model is type accepted, so the VHF may well be also. But what does it matter.....??? If you are in the USA, don't bid.

What? Something is "unbeakable" because it hasn't been broken yet?

Wish that applied to my GPSr, my car, my TV, etc.

Sounds kinda stupid to me - I guess "codes" are different.

If it's being used in the amateur 2-meter band, certification (nee
"type acceptance") is not required in the U.S.. It's necessary for
amateur equipment to comply with the power, spurious-emissions, and
other limits specified in Part 97, but it is _not_ necessary for the
equipment to have been formally certified or tested to meet those
limits.

I am relatively new to ham radio and attended my first 'ham-fest' this past weekend, picking up a used AEA PK-96 modem. It came with no cables or documentation - and the battery had been removed and put in a package with the item. I have re-inserted the battery, and powered it up and the lights in my serial tester show activity in the power up. Is there a place that I can download documentation on this item? (I did a web search using both Google and Copernic Agent and only came across places that sell the item, or praises for the documents that are not on the sites.). Any information would be good - thanks.

And Amen to that too.... I wasn't thinking of HAM, only the original posters bent on it not being for commercial use. Too many panties in a bunch... so it's a ham radio that's already MARS modified. :) Check and see, though and email me direct, I was under the impression it was Part 15 for ham stuff acceptance (as you said, tested only for crappy signal output).
thanks for pointing that out as well, Dave.

When someone claims a code or cypher is unbreakable,
the only way to refute that claim is to break it.

> Wish that applied to my GPSr, my car, my TV, etc.

It doesn't.

> Sounds kinda stupid to me - I guess "codes" are different.

Codes and cyphers are not physical objects.

Does this rig use a synthesizer for band switching, combining with the VFO through a mixer for LO injection? If this is the case, your synthesizer could be out of lock. Possible reasons.....the reference crystal for the synthesizer could have died, if there is a VCO coil for setting the capture range of the PLL, that adjustment could have drifted over the years, or the regulator that supplies tuning voltage for the VCO could have a problem. I hope that this helps.

Greetings to the Group:

There is a Harris RF-110 Amp missing the tubes, cabinet and PS
listed on eBay item # 3015886498. This should make a great source of
parts or a restoration project for someone. Current price is 75 bucks,
have fun.

No, that's one way to demonstrate that it is breakable.

Another way is a mathematical proof that it can be broken, without
actually demonstrating an example.

But who claims that any particular cipher is "unbreakable", in the
absolute sense, anyway? Some are just a lot harder to break than
others.

FT-102 transceiver FS

9 band transceiver, SSB/CW, mains powered,
with mic, leads etc.

condition: cosmetic. very nice, no scratches, no dents.

electrically: only rx's with rf amp on, when off weak sig.
pa's giving about 80w o/p, no doubt some new valves would perk it up.
otherwise electrically fine.

price: £150 to include postage to UK address only. (will not ship
overseas)

BN.

> I'm not going to trying to prove anything one way or another...

Snarky mode off. I welcome comments (be they praise or public flagellations), particularly from those with knowledge and experience. This newsgroup needs more of such! But damnit, if you can't, or won't, prove direct claims, then maybe you shouldn't be making them in the first place. Even your NSA Security Guidelines Handbook (old versions online now) says the same thing, now that you are (apparently) attempting to invoke not just simple authority (cashing in on your reputation here), but _secret_ authority.

So call me ignorant, call me an idiot, say whatever you like (as they say: I've been called worse, for better reasons) ... but only if you can _prove_ it to me.

Maybe you should have read more of this thread before opening your
mouth:

In article <3E84B7D5.3E129CE1@mchsi.com>, Sam Wormley claimed:

>But, in fact, it is still "an adequate key", i.e., unbreakable with
>computer technology.

So when I ask Wormley to prove his claim, I am, according to you,
asking Wormley to prove a negative, and so this makes me the guilty
party ... even though it is _his_ claim.

Ok! I yield! Against this sort of stellar logic, I can only slowly
back away, hands in the air, speaking softly so as not to overly
agitate the loonies...

I've been using the ATAS-120 with a Comet duplexer for about 2 weeks.
It appears to be working on the VHF/UHF bands as good as my former
'Thru-the -Glass' antenna. In fact, I think the ATAS hears better. I
havn't used it on 2 meters enough to make a objective opinion, but I
can say that it's not bad!!!

These observations are based solely on my gut-feel and not on
scientific testing methods. I like the antenna.

I seem to remember a jumper move on the switch board that is under the
trap door on top. To move the jumper you need to remove the top cover.
I don't have a service manual other wise I could tell you what jumper
to move. There are only a couple of jumpers on the board. I am sorry I
don't remember exactly which one to move. They plugged onto pins so it
was real easy to do. I think you are in Europe, You might call one
Icom centers there to see if they can tell you about that jumper.

3319. Jupiter Mic wiring question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-02 02:29:43 UTC
From: n2rll@aol.com
Message-ID: <20030401212943.22051.00000147@mb-fv.aol.com>
Source record: 31651

I'm trying (and making myself crazy) to wire a new microphone - a new D104 from Workman electronics with 9-volt battery in the base to my Jupiter with no luck. I've followed the Jupiter wiring diagram on page 1-2 and contacted the Workman folks who said, (going clockwise) PTT is red, Gnd is blue/shield, MIC is white and at the +9 Vdc terminal no wire is connected. I did it...twice, and my solder connections are fine. The rig appears to transmit when the PTT is pushed (TX lights) but there's no modulation. Any help would be sincerely appreciated.
Thanks,
Harold, N2RLL

3320. Help with a phone patch

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-02 02:53:44 UTC
From: Lee Jarvis <ljarvis@tampabay.rr.com>
Message-ID: <Ygsia.97887$M7.1973797@twister.tampabay.rr.com>
Source record: 31652

I've got a friend headed for Haiti on a mission trip and I'll be his stateside contact.

I just picked up a Heathkit HD-1515 phone patch to enable my friend to contact his family and friends. The trouble is that I have no manual for the phone patch and am not sure how it is to be hooked up.

The purpose of the telephone jack on the back panel is relatively obvious. I'm assumming that the receiver audio goes into the REC jack and the MIC jack goes to the transmitter audio input. But what are the two LINE NULL adjustments for and how are they used?

Thanks in advance for the help!

73,
Lee KN4VN

a telephone hybrid allows one to talk and hear at the same time on a single pair of telephone wires. the NULL is adjusted for maximum trans-hybrid loss. in other words when you apply audio to the REC input, which in turn sends audio out to the person on the telephone you adjust the NULL so that the least amount of audio appears to the MIC.

in a full duplex situation (like a repeater or a broadcast talk show) this is very important. if you situation is SIMPLEX transmit only or receive only at one time then i would say you can pretty much ignore the null adjustment. the trancievers speaker is muted when you transmit therefore there is no nees for loss.

the ability to couple into the phone line is what's critical to you. the heathkid should be OK for this as would any low cost coupler circuit with a send/receive relay.

if i recall correctly, one pot was a course adjust and one was a fine adjust. in any event i could never get much more then 12 or 15 dB of loss from a heathkit.

3322. FA : C Crane Justice AM Antenna With Twin Coil Ferrite

Spring cleaning - SHACK SALE!

April 2, 2003

UPDATE - Watch For Updates & Additions

Everything has to go ASAP! Make me offers!!!

*** Communication Specialists TP-154 Repeater Controller ***

Encodes / Decodes PL, DPL and I think inverted PL

Has a courtesy tone

Has a programmable ID'er

Programmable time limits for system and for each tone/code

Lots of other features

Manual with programming, operation and hook up data included

Programmable over the air or via programming jack - uses a touchtone phone.

A great controller for starter / basic systems

TESTED - was used on my system.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-027S.JPG

PRICE LOWERED!

*** Asking $125 Shipped - OR OFFER ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Radio Shack PRO-2067 Base / Mobile Scanner ***

500 Channels
Trunk Tracking - Motorola type I, II. I/II Hybrid, LTR, EDACS
SAME Technology for Weather alerting
PC Programmable
Direct keypad frequency input
CTCSS / DPL decode
4 line Alpha display
BNC antenna connector
Plus much much more features

*** Comes with the following: ***
Mounting bracket
Original user manual
Wall wart power pack - for base use
Serial programming cable
Programming software

This scanner has been tested and works just beautifully. Condition is Very good - non-smoker, never mobile. I bought 2 of them, I just need one now... so
one has to go.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-018S.JPG

PRICE LOWERED!
*** I'm asking $175 Shipped - OR OFFER for the whole setup ready to plug and play... sent 2-3 day priority mail ***

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Motorola P200 UHF 2 Channel Handheld Radio***

SOLD

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Palm IIIx PDA ***

Just your basic Palm PDA

WORKS GREAT!

Maybe it could find a use on APRS or used with a GPS unit.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-021S.JPG

*** $40.00 shipped - or offer ***

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Kenwood TM-742A Multi Bander Mobile Radio ***

SOLD!

-------- ------------ ----------- ------------- ----------------- -------- -------- -------------

*** Kenwood TS-700SP 2 Meter ALL MODE ***

Built in digital display along with analog dial

10W output - perfect for feeding amplifiers

Comes with the 120V AC cord, manual and the original hand mic.

Works good, however the display flickers once in a while when tuning.
Rocking the tuning dial up and down in freqs clears the problem.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-024S.JPG

PRICE LOWERED!

*** Asking $130.00 Shipped - Or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Scott Air Pack SCBA unit (Fire Fighters air pack) ***

Comes with carry / storage case, mask, regulator, tank frame and tank . the
whole complete unit.

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-025S.JPG

PRICE LOWERED!

*** Asking $100.00 ***

LARGE item - please send city & zip for shipping calculation

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** Setcom 7-PR4SB Headset with Boom Mic ***

I'm not sure what radio it is wired for, but it was used with an HT for auto
racing (Pit Crew)

PICTURE AT:

http://www.kmcnet.net/Auction_Stuff/MVC-030S.JPG

PRICE LOWERED!

*** Asking $35.00 shipped or offer ***

-------- ------------ ----------- ------------- ----------------- --------
-------- -------------

*** TX-RX 900MHz Vari-Notch Cavity filters / (Duplexer?) ***

Quantity - 4

Filter Type - Vari-Notch

Model - 15-88-01

Freq - 890 - 960MHz

There is 4 of these filters on a rack mount frame. No interconnecting cables. I was going to send these to TX-RX to have them convert 2 of them to Pass High and make the interconnecting cables - But I went with a different duplexer. GREAT FOR 900MHz HAM SYSTEMS!

PICTURES AT:

http://www.kmcnet.net/Auction_Stuff/MVC-028S.JPG

http://www.kmcnet.net/Auction_Stuff/MVC-029S.JPG

PRICE LOWERED!

*** Asking $140 shipped - or offer ***

-------- ------------ ----------- -------------- ----------------- --------
-------- -------------

There's more to be listed... Keep an eye open for my posts.

I accept Paypal online payments, US Postal Money Orders and TRADES. I don't have any specific list of what I'm looking for in trade.so if you want to offer a trade, send me your "trade list" for what item(s).

Please note, included shipping is for continental US addresses ONLY, Hawaii, Alaska and international addresses, I will calculate the additional shipping needed.

Thanks

Assuming you have wired it correctly then the mic is not working. If you have another radio to listen on. Key up the radio and put finger on the audio line from the mic to the radio. You will hear a buzz.

If you dont, you know you are not on the mic element line. If you do then you have a bad mic element. Or if is preamped put in a battery. Just some thoughts.

Hi,

I have a question for somone who owns a Clipperton L.

How deep is the dip when you tune your amp into a load on the 160 Meter band.

I get almost no dip, regardless of the position of the loading and tune controls.

Thanks!!

Source record: 31664

Several (about 20) years ago QST had an article doing just that on a Collins Rig. It sampled the Carrier Freq, the VFO Freq. added them and then subtracted them from the Hetrodyne Crystal Freq. I built one to use on my Kenwood TS 520 Se which had those Frequencys available on the back via phono plugs. It used some tuned circuits, a Band switch. Some 1496g's for mixers and finally an amp to drive the counter. Mine worked great untill I traded off the rig. Sorry I can't point you to the issue.

Good luck, it will be a learning experience.

> Can anyone ID these?

That is probably a not-too-uncommon transistor used in Morotola's Land Mobile Radio industry. Off the top of my head, I can't recall it's type. Perhaps in a day or two I might get a chance to research it. You might also refer to that transistor as a " M9686 ". A Google search did not turn up any help, but I've found that normal for many electronic parts ID problems. Good luck.

Here is one easy way that should work with that radio.
http://www.ohr.com/dd1.htm
You can use the regular counter, but of course you need to transmit,
and then you need to know how much offset to add or subtract to get
"on frequency". What you can do is find a group that is "spot on " a
freq. IE:. ????.000 Get your radio so it is as close to being on as
possible. You can get within 10-20 hz just by ear if you are careful,
and also go by your reported frequency by other stations. Then switch
to CW and send a carrier strong enough to trigger the counter. "dummy
load preferably" Note the freq. Note the difference in what you see,
and where you know you really are. That is the offset you will need to
use to "zero" a freq. It will differ from USB to LSB most likely. I
used to do it with a TS-520. It's kind of a pain, but it will get you
real close. The DD1 would be much easier and works on receive.

> Thanks!!

I don't have a Clip L, but just from the description, I bet your antenna system impedance is pretty low, and you may be on the low end of the loading range of that amp.
When you get fully loaded or overloaded, the dip is usually much less than when underloaded. Or it seems to me anyway...
Do you read full normal plate current when keyed in this case? Maybe slightly more than normal? Full or near full normal power output? If so, I think you are on the low end of the loading range. As long as it's not too far off, this would be an ok scenario, as the amp is fully loaded. Shouldn't hurt it as long as the plate current is normal, "also grid current too", and nothing is arcing, or the power out is low. The amp would be linear in this case. No problem with splatter. If I'm correct, you are at the low end of the "load" range. Probably on the peg at "0"... If not, disregard...:/ MK

3343. Need help with radio part name

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-03 14:55:30 UTC
From: will7370@yahoo.com
Message-ID: <e88e9b5a.0304030655.d38ded0@posting.google.com>
Source record: 31675

My portable tabletop radios all have a hard little plastic clamp of some type where the AC cord exits the unit. It sort of fits half in and half out of the unit. It clamps on the cord and prevents it from being pulled out of the unit. What is this little clamp called? I need to relace one as I destroyed the original in replacing an AC cord.

Any help or suggestions would be appreciated.

Rob KC7BUM
Portland, Oregon

They're called nylon strain relief bushings and you can order them
from Mouser (http://www.mouser.com).

Hi all,
I have a few days in Indian Shores, Florida (way west from Tampa.)
Any repeaters there that I can access by a handheld?

I have for sale a very nice condition R-390A.
It is from the Motorola 14-PH-56 contract and has original
meters and covers. It is in nice working and cosmetic condition.
Asking $550.00 plus shipping. Continental US only.

Thanks,
Michael

3350. Where to mount it?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-03 19:07:13 UTC
From: Alan Beagley <abeagley@optonline.net>
Message-ID: <3E8C8661.6020800@optonline.net>
Source record: 31682

I got a good deal on an Icom MB-65 mount for the control head of an IC-706 or similar rig, and now I am trying to figure out where to put it in a Chrysler 300M.

The instructions with the mount suggest mounting it either on the glove compartment door or on top of the center console, but the former seems a long way away (it's a big car, and the latch for the glove compartment is closest to the driver, so the mount has to be even farther away); and if it's on the console I'm going to keep bashing it with my elbow.

Anybody else used one of these things? Any suggestions?

. . . And it doesn't help that the mount would far better suit a
right-hand drive vehicle -- not surprising, since it comes from Japan.

I own two Alinco DR600 dual band mobiles. One of them as of late has been losing all of the programmed frequencies and has on occasion not powered up until I did the micro reset routine. Is there a battery in there somewhere that needs to be replaced or am I looking at replacing the radio someday soon? Tnx in advance. Please reply direct de is Bob W8IJG. KB8UHU@aol.com

Hi,

Anyone having a HP8569A spectrum analyzer calibration manual ? I really need it and could exchange it against thousands of other test equipment manuals on CDROMs...

Or anyone knowing if the calibration of this one is close enough to another HP one (8565 ? 8559 ?), preselector aside ?

Thanks for your help,
Robert

Kantronics KAM
Old unit, has the GTOR upgrade.
Firmware perhaps version 6.2, not certain.
Cosmetically excellent.
Working when removed from service two months ago.
No manual.
Connectors included.
Asking $100.00 plus shipping.

Tasco uTNC21
Pocket size TNC2 clone, same as Heath HK-21.
Firmware version 1.6
Cable, manual and wall wart included.
Like new condition.
Working when removed from service two months ago.
Asking $50.00 plus shipping.

TAPR TNC1
"Gucci" case.
KISS firmware.
Many spare chips.
One of the very first sold by TAPR, circa late 1983.
Working the last time I plugged it in.
Original manual.
Asking $50,000.00 make me an offer over $25.00 :-)

> ---Joel Kolstad

Hi Joel,
You can build your own using the resistive bridge that has been for years featured in the ARRL Handbook. With 1/4W carbon comps mine has good directivity through 300 MHz. With schip componenets there is no reason you could not extend the range to a GHz. 100mW is more than sufficient for F.S. deflection.

If you're not afraid of building it yourself, check out this URL:

http://www.webx.dk/oz2cpu/radios/miliwatt.htm

1 - 500 MHz (900 reduced accuracy), from nanowatts to 1W, use AD8307, PIC,
LCD. I've seen it and it works beautifully. Should cost you less than $100,-
.

<< What's the max tx-power on FM-mode and SSB-mode with a Kenwood 430 ?
Is it possible to adjust FMpower ? With the carrierknob or are there other
possibillies to adjust ? Has the 430 an internal antennatuner ? >>

Rollo-

It has been a number of years since I sold my TS-430S, so I can't remember all the answers. A couple of things I do recall are:

(1) It does not come with FM unless you have the FM-430 option.

(2) The TS-430S does not have an internal tuner option.

If your plan is to use it primarily for Ten Meter repeaters, the TS-430 may not be the best choice. There are only four standard repeater pairs, but I think less than four of the memories can be programmed for split operation. Use on FM is limited if a repeater requires tone, since the FM-430 does not have a tone option. If you add a tone generator from another source such as Comm-Spec, it is normally set for a single tone, so you have to open up the radio to change it for a different repeater.

Sorry if I answered the wrong question!

I assume you've tried a reset on that rig? My suggestion - if it really is the problem that Yaesu says it might be, just buy a new one. For what you'll pay in shipping and repair, you would be close to paying the same price as a new one anyway. Also, you could sell the old one as-is, with the problem described. There's a very good chance you'd find someone with the technical know-how and equipment to fix it for themselves, and with the difference between what you pay for a new one and what you get for your old one, you'd probably make out better than having it fixed.

Just my $.02.

No problem. I love the FT-1500. I had one a while back that I used as a base rig until I bought an FT-100D. I had a dualbander in the car. later on I sold the dualbander because I never used 70cm in the car and bought another FT-1500. I don't think I'll part with this one again! I got the programming software so it's easy to setup too.

Model is H04SDH9PW7AN

Radios are in VGC and come with battery and antenna,only 1 charger
available and it will be available on first come basis.

I was told this radio covers 450-512mhz.
Radios cost NEW $2600 Ea. but you can buy both radios with 1 charger
for $2400.

If you want to buy only one $1250 .
Prices are plus s/h+ insurance.
This wont last at this price so let me hear ya!

Thank you for looking!

Is the standard 13.8 volts best?

It appears that many HT's use attenuators to get down to 9.6 volts, or
even 7.2 volts -- creating harmful heat at with 13.8 volt supplies.

Will most ham equipment perform properly at 12.5 volts?

FS: I have some estate stuff I just got. Some of it has been turned on to verify operation (that is isn't dead) and some hasn't. It is as follows:

MD-239 RTTY Keyer unit for T-368 transmitter. This sits on top of the transmitter next to the TN-339 antenna tuner. It looks good and has a cable with it, no manual, $175.

CV-116/URR RTTY dual diversity converter that goes in the GRC-26D shelter with the T-368 and R-390A receivers. $135.

R-45/ARR-7 Hallicrafters receiver, a military copy of the SX-25 (or SX-28, I can't remember), has cabinet, $135.

CV-31D/TRA dual diversity RTTY converter for earlier versions of the GRC-26 series radio centers, $125.

Hammarlund SP-600JX receiver. This is an original black faced version, appears all original, it's alive, $300.

RCA AR-88 general coverage receiver, works, in what appears as original cabinet and knobs, unmodified, $385.

Eldico SBA-1 SSB converter for receivers with 455 IF, has built-in notch filter, noise blanker, appears very nice and clean, w/ manual, $385.

Anyone interested, email me or call me at (979) 693-1461 eves and wknds.

Most equipment will operate from about 12 volts up to slightly over 14
volts. That is the normal variation in a car battery from almost
discharged to what the alternater puts out. There has been a few moble
rigs over the years that will not operate with much less than 13.8 volts.
You will not get the rated output power of most of the rigs designed for a
nominal "12 volts" with less than 13.8 volts , but that should not be much
of a problem. If the HT is designed for 7 to 10 volts , then it will put
out the full voltage with a 12 volt supply and the device that drops the
voltage to the 7 to 10 volts.

If you want to split the hairs, 12.6 is the nominal voltage of a car battery. While I know from other reports there are some mobile rigs designed for 13.8 that will not operate at much lower voltages , I looked at several books on the rigs I have from an old crystal controlled 220 mhz to an Icom 706 and they all specify 13.8 volts plus or minus 15%. This is usually where the internal voltage regulation starts to fall out and odd things hapen to the rigs operation. The power output stage is not usually regulated so the power will be less at lower voltages and higher at higher voltages.

As you say it is hard to design electronic equipment to operate over a wide range of voltages especially where the voltage is on the low end.

I've got a TS-820 and the VFO wanders aimlessly. This is not a digital readout problem (I had that problem too...and fixed it). I think this is the PLL unlocking. Any ideas?

Help! I'd like to get back on the air.

This is all correct, with the exception that 12 volts is not
"almost discharged", but rather is the fully charged voltage of
the battery itself. Higher voltages exist only when the battery
is being charged from an external source. Lower voltages will
exist as the battery becomes discharged. Determination of what
the lowest tolerable voltage is, either for equipment or for the
battery itself, is somewhat arbitrary but generally 12 volt
batteries shouldn't be discharged to lower than about 10 to 10.5
volts.

Obviously the range that could be experienced is indeed a
serious design difficulty! The "normal" range of 10.0 to 13.8
volts has to be accommodated without degradation, and perhaps an
additional 1.0 to 1.5 volts in either direction shouldn't cause
damage. That's a tough assignment.

Hi,

I need a reasonably priced HP 11036A probe to go with the cheapo HP410C meter I just bought at a Hamfest. Also could use one or more AC power cords for the same meter. These are the old style HP cords with the 3 round female prongs.

Thanks,

Please email

Bob

What's the old saying from the song of years ago???? "If you ain't got a thing if you ain't got that swing."
Well that was only meant as a song. NOT for CB. If half the CBers' could see and hear their signal, they would see how much it SUCKS. More is NOT always better. For Christ's sake, you guys use 100+ to talk across the street. I and many more have talked around the world on a whole lot less. Get rid of all the damned noise makers and echo boxes, and it'll sound like you took the shit out of your mouth and MAYBE someone will be able to talk to you in a normal manner. I know some CBers who are even getting sick of it. Yes, I'm a ham, but I started out in CB and still visit it once in a while. Some things never change. If you would go back to legal, it would be much easier to hear your party on your channel and the same for the guys on the next channel. You crank up the power, splash into the next channel, no damned wonder no one can talk.....I know you all don't want to hear it, but that is the way it is. Some people are waking up to smell the coffee. But not nearly enough.

Isn't 12.6 the voltage of a freshly charged 6-cell lead-acid battery,
while 13.8 is the voltage of a fully charged 6-cell lead-acid battery
while still on charge?

Thus vacuum tubes typically had 6.3v (connect them in series) or 12.6v
heaters.

You could do one of two things:

1. Load and read all the old postings in this group, or

2. Wait for him to post again. As I recall, he posts somewhat
regularly and you will likely see more from him.

Yeah, but think of it this way:

A fella is a no-code Tech and just owns an HT. Another one of his buddies is in the same situation- no-code Tech and an HT. The two buddies want to, first of all, earn a General which takes 5 WPM CW. Second, they wanna see if this CW thing is as much fun as all the old farts say, So, instead of just studying boring tapes endlessly, they want to try MCW with their HTs. Might like to experiment and make a circuit to send the tones, too.

Sounds like ham radio to me!

It's not that hard of a proposition to use one hand to key the microphone
and to use the other to key the keyer. Granted it is not the easiest thing,
but it will work.

Also.... using a simplex frequency, use the DTMF keypad! That will work
also. It may not be a perfect tone, but at least with my Icom IC-T7H, it
will send a DTMF tone as long as I hold the key.

I have, and will look for it, a copy of a circuit that is wired into the
microphone inputs of an HT and will send morse code over FM.

Hi Brad,
The first thing I would check would be the tuning voltage at
the VCO input. If you are out of lock, the voltage will either be at the
high or at the low end of the rail. If you have a VCO coil for setting the
tune voltage, this adjustment could have drifted over the years. If that
doesn't work, take a look at your reference oscillator for your synthesizer.
If that isn't working, the Phase Detector has nothing to compare to. The
reference oscillator will set the tuning steps of the synthesizer, if it is
working properly. Another thing that you might check for might be a cold
solder joint, but that would be a hit or miss type of deal. I hope this
helps a little bit. I am not sure of your experience with synthesizers, but
they are much simpler than one might think. Take a look at my website, in
the Links/Information section, and I have a pretty good description of how
these things work. The URL is:
http://home.att.net/~n.gianakopoulos/wsb/html/view.cgi-home.html-.html
Feel free to shout me down directly, if you have any questions. I worked
for awhile in the Synthesizer Group, over at Rockwell-Collins, so I had some
pretty good help from the good folks out in Cedar Rapids. A good bunch.

Pete

Motorola expects the supply voltage in a vehicle while it is running with a properly working charging system to be between 13.8 and 14.7 volts. (The voltage of a fully-charged battery with the engine turned off is nominally 12.6 volts.) They've been making two-way radios for a very long time, so I have to assume that their values are correct.

As to the requirements for a particular piece of equipment, you should go by the manufacturer's spec sheet or the equipment manual. Don't assume that you can just drop the supply voltage, since they might use a simple series zener diode to drop excess voltage.

3449. ICom 746 Question on Display

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-07 19:05:17 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <NZjka.13676$4P1.1175458@newsread2.prod.itd.earthlink.net>
Source record: 31631

Hi all,
I bought an 746 about 12 months ago, and after some initial testing, I then placed it in a box, opening it up about a week ago.
All is well, but.. the display seems like it takes a few seconds before it becomes bright.
I know of the two transistor replacement but is this normal? Should I order the two transistors now??

--
Best Regards, Frank, KG9H

3450. Original (/\/\ ) "NEW" Rib Box & Acc'y Cables

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-07 19:45:17 UTC
From: msisco9939@aol.com
Message-ID: <20030407154517.19789.00000096@mb-cc.aol.com>
Source record: 31632

HI:

Original (/\/\ ) "NEW" Rib Box & Acc'y Cables

Tired of problems with your clone? Corrupt a radio with a Clone
Rib box or a poorly made cable?

This is solve your problems forever AND protect your radio from
a 279.00 ~ 379.00 Depot repair bill.

I have a Couple left.

This is a " Complete " Set up, and comes with a Factory Original Motorola
Rib box (not a wannabe or a copy) New Duracell Battery, Rib to Computer
Cable, Power Supply, Instructions, and is still in the Anti-Static bag.

A photo can be seen @ http://www2.4dcomm.com/metrotech/m_ribox.jpg

235.00+8.00 for Pirority Mail S & H + Tracking

==========
If you are into " Professional " Motorola Service, I
have a couple of " Smart Ribs " SRIB RLN1015's
too, but they are a bit more expensive. I can sell
just the SRIb for 295.00, or Brand New Setups
for 475.00. Email me for details if interested.
==========

Also, if you are in need of " Factory " program cables, I have them for
most Motorola portables, and if you have a tight budget, I also have / make
" Detail" replacement.....Not all Clone Cables are the same....check out
the photos, you be the judge of which one is better.

From a local ebay site which sells cables
http://www2.4dcomm.com/metrotech/bad_cbl.jpg

The above cable tosted a Spectra Radio, and the Rib box due
to improper wiring

http://www2.4dcomm.com/metrotech/my_cbl.jpg
This is how we make ours.

Anyhow, we have them for the CDM/pro Series, Maxtracs, HT600 / P200's
Saber Radios, Astro-Saber , MTS2000's, XTS3000's Visars, and we can
make any cable you desire.....Or if you are savvy @ construction....Well
we can supply you with all the parts, and you can " build " your own.

Postal Money Orders, Cashiers Check receive Prompt and immediate
processing, " Personal and Business checks A-OK too if you do not mind

a short shipping delay for bank processing

Monty

3451. Re: Best SSB Filter for IC-718?

Newsgroup: rec.radio.amateur.equipment

Source record: 31639

There you go. 3 choices, 3 answers. That's the wonderful thing about radio.

Try it without an option for a while and see if you want better fidelity - wider filter; or the ability to dig stuff out of noise and QRM - narrower.

I've had 3 rigs for which I bought 1.8 kHz filters and found them useful, but honestly only used them very infrequently - the degraged audio range may make it possible to dig an Ident or short QSO out, but for anything longer the audio fatigue they induce is not worth it. I don't think I'll buy any more filters narrower than 2.1 kHz for SSB.

Are you certain you will not need an AM, CW or TTY/Digital mode filter to fill that slot in the future?

Good luck
Dave

>Thanks.

Along with front end selectivity, the choice of 1st IF frequency
determines rejection ability for signals at the image frequency.

Along with 1st IF selectivity, the 2nd IF frequency determines
the adjacent channel selectivity.

All of the above are significant in determining adjacent channel
blocking. More gain towards the front end is worse, and
more selectivity towards the front end is better, and in both
cases cost is reduced by moving that functionality farther
down the line.

Triple conversion is not necessary for any of the above! What
it adds is design flexibility! It can allow more practical (in
price or availability) choices for bandpass tuning, less complex
transceive functionality with a matching transmitter, common
modules for multiple equipment design implementations, and
perhaps allow just lower cost (LC as opposed to more expensive
channel filters, for example) components.

Actually,

The primary advantages of double and triple conversion have more to do with
image rejection than even selectivity, although the more IF stages, the
better the selectivity.

<< Can anyone suggest a reasonably priced (several hundred dollars, give or take?) wattermeter that functions at VHF for low power levels (say 100mW full scale)? Something like the Oak Hills Research WM-2QRP (http://www.ohr.com/wattmeter.htm) with a higher upper frequency range would be ideal. >>

Joel-

I like the other suggestions to build your own. However, if you are serious about spending "several hundred dollars", you could invest in the Bird Model 43 wattmeter. There are separately-purchased elements for it, to cover most combinations of power and frequency a Ham might encounter. It comes standard with type-N connectors, but other "QC" (Quick Change) connectors are available.

There are individual 100 mw and 500 mw elements for each of the Two Meter and 440 MHz bands. There is also a 250 mw element for the Two Meter band. I haven't priced these recently, but suspect they each approach the cost of the basic meter. Higher power "Table 1" elements are probably in the order of $80-$100 each.

If you were interested in HF QRP, the Model 43 would not be a good choice. For HF, the lowest power element is 50 Watts. For VHF (25 MHz and up), the lowest power "Table 1" element is 5 Watts. For more money, 1 Watt and 2.5 Watt elements are available for the VHF & UHF Ham Bands.

Until a couple of years ago, Amateur Electronic Supply carried Bird products, but they are no longer listed in the AES catalog. If you want to pursue Bird, you may have to contact them directly. See http://bird-electronic.com/.

>Actually,
>
>The primary advantages of double and triple conversion have more to do with
>image rejection than even selectivity, although the more IF stages, the
>better the selectivity.

Only the 1st conversion affects image rejection, which is a function of front end selectivity compared to the 1st IF frequency. The 2nd conversion has no effect on image rejection itself, and may actually increase problems do to poor image rejection if there are birdies from interaction between an image signal and any of the signals resulting from a 2nd conversion.

The 2nd conversion necessarily affects selectivity if and only if the 1st IF is too high in frequency to obtain the desired selectivity, and otherwise is not even be needed. There is no benefit to choosing a 2nd IF which cannot provide selectivity.

And hence there is no need to even have a 3rd conversion in order to get selectivity; and like the 2nd IF, the 3rd conversion has no effect on image rejection.

More IF stages (or more conversions, either one) do not necessarily provide better selectivity. In fact both fewer stages and conversions, with selectivity as near to the front end as possible, will result in better intermod, fewer birdies, an better blocking characteristics.

The above applies to HF and VHF, but may or may not apply above that range. For example with geosynchronous satellite receivers conversions are necessary for different reasons (antenna mounted 1st mixers, for example, might be used to reduce the feedline losses and improve noise characteristics, neither of which are important at HF) and in such designs the characteristics normally required of a 2nd IF may instead be found in the 3rd IF.

hey tom
they sell the parts for all there antennas all you need to be is paitent
i ordered the replacement hairpin match for there 6 meter vertical
(which mind you is only a 3 foot piece of 1/8th in aluminuim wire) and
it took 8 weeks to get the part out of them this was about 3 years ago
a year before that i ordered a NEW 2 meter 9 ele yagi from them and
again it took 8 weeks to get it
so they are anyhting but quick

Wow! Thanks for all the information. So if I'm comparing a TS-430S (double conversion) with a TS-440S (triple conversion), and the selectivity specs are identical, would it be fair to say that I would not notice a difference in a pile-up, or other conditions for that matter? Or am I leaping to an unsubstantiated conclusion?

For a good example of how single conversion can be better than multiple
conversion, visit the Elecraft site http://www.elecraft.com
and go to the rig comparison page.

Source record: 31559

Thanks for everyone's feedback.

The comment that the narrower 1.8 kHz one will be a tad too narrow is one that I've heard before. For this reason, it sounds like I'd be best served by a 2.1 kHz filter (available from http://www.qth.com/inrad/).

Might I need a narrower filter in the future for digital modes? Maybe in the future, but now now. By then, maybe I'll have another rig to dedicate to digital. :-)

As a new development, I have downloaded the IC-718 manual from Icom in the meantime and it looks as though the standard built-in filtering capability is 6 kHz (wide) and 2.4 kHz (normal) so nothing wider than 2.4 kHz makes sense. That eliminates the 2.8 and 3.3. It's nice to be able to read the manual before you buy.

Thanks again.

73,
Ariel

There is absolutely no advantage of one over the other, or for that
matter over single conversion.

You have to look beyond the number of conversions, because all
receiver design is a tradeoff.

The whole point of a superheterodyne receiver is to convert the
incoming signal to a fixed frequency where gain and selectivity
can be easily done.

A byproduct of that conversion is the image frequency. Getting
rid of the image response requires either a lot of front end
selectivity, or an IF that is not considerably lower than
the signal frequency.

If you can make a conversion to a frequency where you can get
sufficient selectivity, and provide sufficient rejection of
the image response, then you only need one conversion.

If you could get enough selectivity at the signal frequency,
then you wouldn't need to do any conversion. But this was
only possible in the early days of radio when signal frequencies
were relatively low; nowadays, you could put a crystal filter
between the antenna and the rest of the receiver and get enough
selectivity, but there is no way it could be made tuneable.

In the beginning, and Armstrong patented the superhet back
in 1920, the only place to convert was down. That was where
one could get good amplification, and nobody had cooked up
crystal filters at that point, so selectivity had to
be done at low frequencies where LC circuits provided
a narrow enough bandwidth. But as signal frequencies
gradually went higher and higher in the radio spectrum,
as they learned they could be used and as the need for
more space came along, image response became a bigger issue.

455KHz has been a fairly standard IF frequency over the years,
but those early IFs were even lower. But let's use it
as an example. Say you want to listen to WWV at 10MHz.

The local oscillator has to be either 455KHz higher or lower
than the signal frequency. If you pick lower, then it
will be at 9.545MHz. 10MHz=9.545MHz+455KHz. But wait,
9.09MHz will also convert to 455KHz with this LO frequency;
9.09MHz=9.545MHz-455KHz. Since these two frequencies
translate to 455KHz, there is nothing to differentiate
between the two. You have to put selectivity before
the mixer to select which one is passed on. The image
will be the one you don't want, and it will be (in this case)
910KHz away. If your signal frequency is low enough,
say the broadcast band or low shortwave bands, a tuned circuit
or two will be sufficient so the image frequency is not
down enough. But as you get to the upper shortwave frequencies,
it won't be. You have to put up with horrible image
rejection (as many low end receivers of years gone by did),
or put a lot of tuned circuits on the signal frequency, which
adds it's own problems.

But eventually, double conversion was introduced. Drop
the incoming signal to a frequency where good image rejection
was still possible without too much front end selectivity.
Yet at the time, this first IF (intermediate frequency) would
not be a suitable place for ultimate selectivity. So another
conversion was added after that, often to that common 455KHz,
where there was a good filter. (And of course, triple conversion
just extended the idea.)

When high frequency crystal filters became available, they could
go back to single conversion in the better receivers because
a frequency in the MHz range would put the image frequency far
enough away from the wanted signal, even in the upper HF range,
that there was good image rejection without a lot of front
end filtering. And the crystal filter allowed for the needed
narrow filtering, so they did not need to rely on a low frequency
IF to provide this.

For some years, starting in the early sixties, single conversion
with a crystal filter, in the 5 to 10MHz range was the norm
for a lot of equipment.

But then the manufacturers wanted to add features, so they
went to double or triple conversion. Features, not basics.

And they moved to first IFs that were above the shortwave band,
like 40MHz or higher. There were specific reasons for doing
this, but it had the disadvantage of requiring a move
back to double conversion, because narrow selectivity filters
at those frequencies were either impossible or way too expensive.
So they had to drop down in a second conversion to a frequency
where once again sufficient selectivity was available.

Any conversion adds spurious responses, as Wes Stewart points out. But in receiver design, if you do something here, often something else happens over there. You can't judge something by how many conversions it has. You have to look at the overall design and specs. Because multiple conversion is just a means to an end, and sometimes there are other paths to that end, which may result in a cleaner design.

Icom IC-746 with UT-102 voice sysnthesizer unit.
Has FL-223 narrow SSB filter. No mic. Display "dim"
feature does not work, but is lit very well. Just won't
dim. Everything else about radio works like new. The
radio looks like new. Original box and manual.
700.00 plus shipping

Drake L-4B amp. Amperex 3-500z tubes, full output.
Very good cond. With L-4PS power supply. 700.00
plus shipping. Have the Drake 2 pin plug with it. Will
ship in 3 boxes, tubes and glass chimneys, amp,
and power supply. 700.00 plus shipping

Astron VS-35M power supply. Adjustable amp &
vollts with separate meters. Very good condition.
80.00 plus shipping

Mirage B 5016 G 2 mtr mobile amp. 50 in 160 out.
I don't think the receive amp works or at least not
very well. Output fine. 150.00 plus shipping

Dentron Super Tuner plus. Works good, good cond.
100.00 plus shipping

I will try and help out with the shipping on these items.
Located S.W. Ohio 45122

Note* I am a smoker and if thats a problem, don't buy.
All items are sold "as is" with no warranty. Last used
a few years ago and everything worked very well.
Getting out of hobby and only trades I might be
interested in would be Chevy racing or Pro Street parts.
Thanks,
N8MKP

Source record: 31568

You folks are correct, in that a single conversion or direct conversion (homodyne) receiver would be the cleanest, but there is another aspect to having that extra conversion. This is just one manufacturer's philosophy, but their guidelines suggest no more than 80dB of gain at any one frequency, so it you do want to have that 140dB gain that some of the high end receivers have, the easiest way to get that much stable gain is to use an extra conversion. Since for good I.M performance, minimal gain is desired ahead of the 1st mixer, that only leaves the I.F. strip and the audio chain. Many of the ham transcievers from the "big 3" don't have as much system gain as their receivers. In many cases, this is because of that extra I.F. strip. I believe that all of the currently available transceivers from the "big 3" are of an upconversion design, following by an I.F. strip in the 5 to 9MHz range. This works out ok, but you won't get that roaring type of gain with this scheme, with one exception. That exception would be the Transworld TW1000. I did have a couple of those units for awhile, and they did something magical with their design.
A good way to test a receiver is to see how loud the noise is, without an antenna. If it is moderately loud, you have a good start. When you connect an antenna at the 30MHz end of the range, that noise should get much louder. The Drake 7 line wasn't the hottest up there, until you replaced those 1N4148s that were used in the 2nd mixer and the translation mixer with matched 1N5711 Schottky diodes.

3487. DC input Vs output power

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-08 23:47:26 UTC
From: enigma_y_2000@yahoo.com
Message-ID: <3e935f72.16822138@news.usfamily.net>
Source record: 31569

Hi,

Is it possible for a linear amplifier to have normal DC input power to the final tubes, but to be way low on output power delievered to a dummy load due to weak tubes? Yes, I'm loading it properly.

Or will the weak tubes always show up by not loading to full DC input power?

Please reply by email.

Thanks,

Bob

Power cannot disappear into thin air.

If power is going in but not enough is coming out then it must be being
dissipated in the tube plates. The tubes are being damaged.

On the other hand, are you sure accuracy of your input and output power
measurements are OK ?

Connect it to an antenna, tune-up and ask somebody what it sounds like. Does
it tune up OK ?

* ICOM IC-735 HF transceiver in very good condition
* HM-12 Hand Microphone with up/down switch
* Power Cable
* Operation Manual
* FL-32A 9.0106 mHz (500 hz) CW filter installed

$350.00 plus shipping from 97006

Thanks,
Rick <><
W7RBR

Please reply to:

|>
|>
|There is absolutely no advantage of one over the other, or for that
|matter over single conversion.
|
|You have to look beyond the number of conversions, because all
|receiver design is a tradeoff.

Amen.

Michael makes some excellent points in his well written summary.

I would just add that modern transceiver design seems to be driven by
"bells and whistles". The perceived "need" for infinitely variable
selectivity and passbands requires an extra frequency conversion or
two to implement. Frequency coverage from DC to 30 MHz without a
tuned front end almost necessitates an up-conversion to a frequency
above 30 MHz.

For example my TS-870 has a first i-f at 73 MHz, a second at 8.8 MHz,
a third at 455 KHz and a fourth at 11 KHz (the DSP frequency). And
even at that because of the crappy crystal filters they use, strong
signals overpower the DSP.

But, the radio tries to be a CW, SSB, AM, FM and PSK rig. It does
pretty good at all of them but doesn't excel at any.

|
|The whole point of a superheterodyne receiver is to convert the
|incoming signal to a fixed frequency where gain and selectivity
|can be easily done.
|
|A byproduct of that conversion is the image frequency. Getting
|rid of the image response requires either a lot of front end
|selectivity, or an IF that is not considerably lower than
|the signal frequency.
|
|If you can make a conversion to a frequency where you can get

|sufficient selectivity, and provide sufficient rejection of
|the image response, then you only need one conversion.
|
|If you could get enough selectivity at the signal frequency,
|then you wouldn't need to do any conversion. But this was
|only possible in the early days of radio when signal frequencies
|were relatively low; nowadays, you could put a crystal filter
|between the antenna and the rest of the receiver and get enough
|selectivity, but there is no way it could be made tuneable.
|
|In the beginning, and Armstrong patented the superhet back
|in 1920, the only place to convert was down. That was where
|one could get good amplification, and nobody had cooked up
|crystal filters at that point, so selectivity had to
|be done at low frequencies where LC circuits provided
|a narrow enough bandwidth. But as signal frequencies
|gradually went higher and higher in the radio spectrum,
|as they learned they could be used and as the need for
|more space came along, image response became a bigger issue.
|
|455KHz has been a fairly standard IF frequency over the years,
|but those early IFs were even lower. But let's use it
|as an example. Say you want to listen to WWV at 10MHz.
|The local oscillator has to be either 455KHz higher or lower
|than the signal frequency. If you pick lower, then it
|will be at 9.545MHz. 10MHz=9.545MHz+455KHz. But wait,
|9.09MHz will also convert to 455KHz with this LO frequency;
|9.09MHz=9.545MHz-455KHz. Since these two frequencies
|translate to 455KHz, there is nothing to differentiate
|between the two. You have to put selectivity before
|the mixer to select which one is passed on. The image
|will be the one you don't want, and it will be (in this case)
|910KHz away. If your signal frequency is low enough,
|say the broadcast band or low shortwave bands, a tuned circuit
|or two will be sufficient so the image frequency is not
|down enough. But as you get to the upper shortwave frequencies,
|it won't be. You have to put up with horrible image
|rejection (as many low end receivers of years gone by did),
|or put a lot of tuned circuits on the signal frequency, which
|adds it's own problems.
|
|But eventually, double conversion was introduced. Drop
|the incoming signal to a frequency where good image rejection
|was still possible without too much front end selectivity.
|Yet at the time, this first IF (intermediate frequency) would
|not be a suitable place for ultimate selectivity. So another
|conversion was added after that, often to that common 455KHz,
|where there was a good filter. (And of course, triple conversion
|just extended the idea.)
|

|When high frequency crystal filters became available, they could
|go back to single conversion in the better receivers because
|a frequency in the MHz range would put the image frequency far
|enough away from the wanted signal, even in the upper HF range,
|that there was good image rejection without a lot of front
|end filtering. And the crystal filter allowed for the needed
|narrow filtering, so they did not need to rely on a low frequency
|IF to provide this.
|
|For some years, starting in the early sixties, single conversion
|with a crystal filter, in the 5 to 10MHz range was the norm
|for a lot of equipment.
|
|But then the manufacturers wanted to add features, so they
|went to double or triple conversion. Features, not basics.
|
|And they moved to first IFs that were above the shortwave band,
|like 40MHz or higher. There were specific reasons for doing
|this, but it had the disadvantage of requiring a move
|back to double conversion, because narrow selectivity filters
|at those frequencies were either impossible or way too expensive.
|So they had to drop down in a second conversion to a frequency
|where once again sufficient selectivity was available.
|
|Any conversion adds spurious responses, as Wes Stewart points
|out. But in receiver design, if you do something here, often
|something else happens over there. You can't judge something
|by how many conversions it has. You have to look at the overall
|design and specs. Because multiple conversion is just a means
|to an end, and sometimes there are other paths to that end,
|which may result in a cleaner design.
|

I know this is off subject, but there is a lot of good input here. I
am posting for a friend, he has a Cobra 146gtl,SSB that was in
storage for several years, and he would like to have a 'ballpart' idea
of what to ask for the unit on sale.????? From my point of view
apperance wise I would say "8 on a scale of 10'. There is NO mobil
mount..
He also has two '8 track' Stereo Recorders, brand name ,,,, CRAIG
about a 7 or 8 on 'the scale',,,,, the second 8 track recorder is a
JVC, on the 'scale' about a 9.
I had 8 track when I was younger, but didn't know until I saw these
units that there WERE 8 track recorders ''''outthere''''. I will
relay any and all info about the sale value of these three units.
Thanks in advance. cl.

I have a non-icom rig with a 1.8 filter that so strangles the ssb
audio, I rarely use it. You're probably better off using the standard
ssb filter, and the passband tuning to cut out interference. Save the
extra filter slot for a filter you can use on cw or digital modes.

Icom has markets other than the USA. I believe that the 703 will fit
right into one of the Japanese entry licence classes. And, with a
little bit of effort, they bring it into the US to check out the market
for low-power rigs- like the Ten-Tec Argo and the Yaesu rigs.

Kenwood is the company that is way overdue for upgrading their mini-rig
selection. Don't know if I'm in favor of the mulit-multi purpose rig
like the Yaesu rigs but, as it stands, the TS-50 isn't a good value.
If it cost about, say, $450-500 on the street, that would be one thing
but not at the current street prices.

For Sale;

Dentron Clipperton V 2M-6M amp, $550
In good working Condition,
2 NIB Eimac 7203/4CX250B tubes
1 4CX250B pull (No brand name)
1 NIB Amperite 6N06OT time delay
1 NEW Eimac SK620 socket and chimney
1 Good Eimac SK600 socket
1 New Eimac SK600 socket

Kenwood TMV7A 50W 2M/35W 440 FM $300
DFK3C REMOTE CABLE KIT
PG4S PC INTERFACE CABLE + SOFTWARE

Standard C568A 95% $185

Standard C468A 95% $125

PacComm Sprint-2 TNC Like new, $100
With AD-4 AD board
With cable for Kenwood TM451A

Icom 02AT with BC-35, $ 75
And Ice brick battery

Dynamic Communications
Model A470-25 $ 25
Sold as is, no manual.

Model 10-0 $ 25
Sold as is, no manual.

Carver Audio Amp 95+%
Model M-2120
With Manual. $ 50

C64 hardware, and software. To much to list. Contact me
with your needs. Will sell piecemeal, or as package.

All Items Will include manuals, and any
docs that I Have. I can email pics.

SHIPPING IS NOT INCLUDED!

I had a Kenwood TS440S with a 1.8 filter. I NEVER used it!!! Wasted money!

The Nye Viking is a good patch. In fact, Icom used it in their phone patch by just repackaging it in their box. If you look inside you can see the Nye Viking identification. Picked one of the Icom's up at a swapmeet for $20. Besides being a good patch, the Icom has a nice speaker in the box too.

The line null adjustments are to balance noise out of the phone line. Dial a local number and have the party on the other end stay very quiet. Adjust the null controls for a minimum on the phone patch meter or by ear to eliminate hum, buzzing, clicks, etc.

The line null adjustments are to balance a hybrid bridge circuit
that reduces the receiver's output in the audio delivered to the
transmitter. It does *not* affect "noise out of the phone
line".

An exact adjustment is unique for each connection dialed on the
telephone line; hence, it may or may not be correct from one
call to the next. With modern equipment it is very likely to be
close enough for practical purposes, but experimenting with the
actual telephone lines that will be called for patches might be
very productive.

First, note that if VOX is not used, it makes *no* difference at
all. The only benefit to balancing the circuit is to allow VOX
to be used on an active patch. If your parties are really good
at using VOX this is worth making an effort to get right,
otherwise it's a waste of time unless you just want to play with
it to learn.

Here is a proceedure to very accurately set the null adjustment
for a given telephone connection. This requires that the
receiver not be muted, that the tranmitter be tuned into a dummy
load, and that the specific telephone line be dialed up and the
answering party must either put you on hold or place their hand
over the telephone set's transmitter and hold it quietly to
avoid any audio from their telephone from being sent to your
transmitter. Your telephone set must not be connected or must
also be muted.

Key the transmitter, and tune the receiver to a frequency where
nothing but background noise is heard (for example, tune the
transmitter up on 10m and put the receiver on 80 meters in the
middle of the day). Turn the receiver output (and the
transmitter mic gain) up high enough to cause transmitter output
(into a dummy load!), and adjust the null on the patch for a
minimum transmitter output.

This can be done in other ways, but none will be as precise.
The precision comes from using a "pink noise" that exactly
matches the audio bandpass. Adjusting on a single tone may or
may not provide similar results (a 30 dB null with a single tone
might result in 5 dB at other frequencies, for example).

The components adjusted are part of what is called a "compromise
network", and it is usually intended to be close, though perhaps
not the best, for almost any line. Trying it with several lines
will indicate how good the compromise is on your given line with
the particular lines that are being called. It may be close
enough to just set and forget, or it might require different
settings for different called numbers. (If you have a patch
with a vu meter, expect to be able to null out between 10 and 25
dB, with 15 dB being the most likely value. Measure this by
simply pulling the plug out of the phone jack to totally
unbalance the hybrid.)

Or you might find the whole thing a PITA and notice that your
parties can't figure out how to use VOX anyway, so you'll insist
on manual switching and tell them to say "over" when they want
to switch sides!

If anyone would like in depth details on telephone hybrids and
their adjustment, just ask and I'll whip out some ascii drawings
and explain how a phone patch works in enough detail to bore
anyone to death. :-)

Thank you! It's a bit out of date and incomplete. But I hate
trying to program with HTML. ;-) Whaling season is almost here,
and the pictures of umiaq skin boats are very representative of
what can be seen here today, as the ones with new skin covers
this year are all out being air dried right now. The spring hunt
will start in about a month.

And, everyone always wants to know about hours of daylight here,
which today adds up to about 15 and 1/2 hours. A month from now
(actually May 12th) the sun will come up but won't go down again
until August. But in only 3 weeks or so there won't really be
any darkness, as there will be enough twilight even at the
darkest part of the night.

And all of that, of course, balances my hybrid... ;-)

> http://www.qth.com/inrad/).

You don't state why you want the extra filter for SSB. Myself, I
wouldn't bother wasting money on a 2.1 filter being you get the 2.4
standard. Only if you work dx or contests with busy band conditions
would it really make sense. For practical purposes, all the filter
does is determine the bandwidth. A 2.4 filter is usually stock and is
the average width used these days. It will work and sound just fine
for most purposes. It will "sound" better than the 2.1 or 1.8 filter.
You have less roll off of the highs. A 2.8 filter is a "wide" filter
as far as ham use is concerned. You would use a 2.8 if you wanted an
increase in the high end frequencies you hear. "400 cycles higher than
the stock filter".
To the average ear, this filter would sound slightly better than the
stock filter, but you would hear more interference if you were near
another signal. "less than 3 kc". Many of the "audio" guys use the
wider 2.8 and 3.3 kc filters. A 3.3 filter is VERY wide as far as SSB
use is concerned. Only a true audio nut would likely go for one of
those. Myself, I would not like a 3.3 kc filter. Why? Because it's a
bit too wide really. The usual spacing between signals is usually 3
kc. If you use a 3.3 kc filter, you will hear a signal 3 kc away a
good bit more than with a stock filter. Parts of their signal is
within your passband. This would not be the case with the stock
filter. Also, be aware that the filter specs are for "6 db down".
Thats not too awful strong a signal. With a STRONG signal, the filter
will appear wider, as the specs degrade. "Note the specs for 60 db
down". This is your strong signal comparison.
>
> Might I need a narrower filter in the future for digital modes? Maybe
> in the future, but now now. By then, maybe I'll have another rig to
> dedicate to digital. :-)

No. In fact, a stock SSB filter works fine for most digi modes.
>

> be able to read the manual before you buy.

Well, it makes sense if you want to hear a slightly higher freq response. But, unless you are an audio nut, it's probably a waste of money.

Myself, if I were you , I would not buy any extra filters until you use the radio a while and decide just exactly what you want. The stock filters are just fine for everyday use. Heck, if you want a narrow filter for DX, just use an outboard DSP program on your puter. Also, this will let you play with all different widths, and let you hear the difference between them. MK

> Kenwood is the company that is way overdue for upgrading their mini-rig
> selection. Don't know if I'm in favor of the mulit-multi purpose rig

Sure wish they would bring out some rigs that are RIGS. It is about time for new units to have the size of the FT980's and IC756's....big cabinets and lots of knobs that do things and are easy to grab onto. The shack is not the shack anymore with one multipurpose rig sitting on the shelf.......

AH the old days.......linears in floor cabinets, rigs that took two guys to carry, and dont forget the warmth in the shack from all those filaments running.....those were the days.....

3525. *******BEWARE OF SALES OR TRADING WITH "Mitch Roberston"

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-10 14:32:14 UTC
From: TIA <no1@nowhere.com>
Message-ID: <v9b07cnrif2v18@corp.supernews.com>
Source record: 31457
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.cb,rec.radio.scanner

Ya know I always know better but for some reason this time I didn't heed my own warning. I had advertised a HR2600 with a chipswitch and 2 - 150 amps for sale. One having a preamp switch problem and needed a new switch but the amp side worked perfectly. And I got alot of action but no sales. Well after 2-3 months I got an email from

MITCH N2RADIO [mitch@n2radio.com] MITCHELL Robertson [MR_CPTN@militaryministry.net]

Stating that he had a 6900TB to and an Boomer 600 amp to trade for my stuff. I was like ok, no problem. I got everything packaged up in bubble wrap and boxed real well. And waited for ups to pick it up. And he was to do the same. Well he gave me a tracking number 2 days later and the package was on its way to me. Well mine left and went to him. I triple checked the operation of all the equipment before I packaged it up. Just because I did a trade earlier that month (Sept) and had a DOA problem with a scanner. So I made sure that the equip worked perfectly. Well I found out that Mitch was in the military and was being shipped out. And his family is moving. So they wouldn't be able to get email for some time.

Well the package arrived at completely the wrong address, which was intentional because Mitch and his wife Laura had both double-checked the shipping addy with me. I finally get the package and guess what? Its 3 Chilton's repair manuals no equipment to be found. Well did I get hosed but bad. So over the next 4 months I emailed both addresses well over a hundred times. And no response at all. Well I have a few connections in the military and I'm making some requests. I'll see what happens it should be interesting to say the least. The last email I sent Mitch and his wife I told him this and told him by Jan 1 If I didn't hear anything I would take action. Still no reply!!

Well as I'm typing guess what, I get a box in ups!! SO I open it up and there is my 2600 back and one 150 amp that I sent to him. And a note that the 2600 doesn't receive, the first amp is dead, and he kept the other amp and sent me 2 beat up 15.00 microphones one with an echo. DAM JUNK!! And a mini para dynamics meter DOUBLE JUNK!!! Then he has the balls to throw in a pc board for an amp kit. Well I just wanted EVERYONE to know what happened to me. So if you do business with him BEWARE I warned you.

I have one 16ch HT-1000 radio in excellent condition electronic and
cosmeticly.
The radio is the "R" model 403-470mhz split. It will do the Ham and
Commercial band at the same time.
Comes with a very good battey, belt clip, antenna and rapid charger.

I will do free programming if needed, just send your info once purchased.

Price: $285 and that includes shipping in the U.S. only.
Payment via Money Order or PayPal

Go to the office store and buy some Card stock there. Same thing. You can
use as simple a program as PrintShop. Why pay anyone but yourself.

I have not checked the prices, but I was thinking it would be cheaper just to get about 500 cards printed vers the do it yourself. I do not send cards first, but if I get one I will send one back. Bought a bunch for about $ 40 a while back.
I have bought a digital camera and while I have not checked the prices exectally, I think it is cheaper to take them to Wal-Mart and get them to do about 24 prints for less than $ 7 than it is for me to print them on good paper. That is for some prints that I really want to send or save to paper.

>Go to the office store and buy some Card stock there. Same thing. You can
>use as simple a program as PrintShop. Why pay anyone but yourself.

I've priced that card stock and while it might be a good idea if you intend on only printing out a few QSL cards, it actually comes out to be more expensive per card than if you buy from a printer if you want a lot of cards. Very often you can find QSL cards in quantities of 1000 for less than $100. That's less than $.10 a card. When you factor in the cost of ink and wear and tear on your printer, it's really not economical to print a large quantity of cards yourself.

About a year ago or so, I sold a handheld to a fellow that was involved with SeaBase.
I did not include the manual, and indicated so prior to shipping but did include a much needed accessory for the user, and you were pleased to have that accessory.
If... that was you, send me an e-mail, telling me what the accessory was and I will send the manual to you .

The cost really depends on what you buy. If you get post card stock with the pre-perferated pages, it comes out to something like $20 for 10 sheets of 4 cards (40 cards total) or sometimes 2 cards, depending on the size. If you get the card stock and use a paper cutter, it would probably be cheaper, but I still think having them printed, especially at $40 for 500 as you mentioned, is a cheaper way.

You can do a few things in this case. You can contact the base provo
martial and file a complaint! You should also send a letter to the base
commander.. Because it went across state lines file a complaint with the US
Postal authorities, i.e. they regulate UPS... And you can also file a
complaint with the F.B.I. because he's in the millitary they handle it..

The Scanner Dude CWO/5 Ret 24 Years :-)

Andy et al-

There is no doubt that a print shop can do it for less than it takes to make your own. Further, printer's ink is less likely to fade than the inks used in most inkjet printers. However, if you do your own, you can completely fill them out on the computer and produce neater cards than ones filled out by hand.

I'm really getting lazy in my old age!

I'm also getting the shaft from Ebayer APCOMIC@AOL.COM. Fortunatly I used a credit card with protection...But I want to prosecute!!!!!!!
I delt with Shaun Allen before and had a good deal, but now I'm NOT. $6??.00 worth of no e-mail responses. The first transaction is the only way I got his name and address, but the sherriff is checking to see if some kind of identity theft took place before I persure.

I'm not so sure about Ebay anymore.....

You can read about everything I tried after being ripped off for $ 650.00 .
Check it out on my web page under Scams on the Swap Pages.
http://www.k5joe.com
You might as well kiss your money good-bye. No one will help. The FBI, US
Postal Inspectors, or the Local PD where the scammer lives. I tried them
all.
Buy from the regulars that post on rec.radio.swap often and usually you will
be safe.

Hi all, here is something that I have heard form a few people,
including a guy at HRO..

Might this be true??????
Anybody do this or know about this being done???

On the ADI AR-247 220 MHz radio
is it possible to mod it with a few switches to make it
do 144 MHz and 440 MHz???
I doubt it but then there are the stories I have heard.

Thanks

Tried contacting your own local Police Department? I had a problem once. I contacted the local boys per instructions from the Police in the area the person lived. I also contacted the Post Master Generals office in my own area. They told me to file a report with them and they (PMG) would take care of it. My problem was solved.

Try contacting others in that area, try the ISP of the person for info, A CORRECT NAME and so on. Some of the things may be long shots. $650 is a lot of cash to lose. Also try contacting the Attorney Generals' office in that state. You can usually find them on the web doing a search of state web sites. Lots of luck...

Try to file a lein on any personal property this bum owns.
Most of the time you can file the lein by mail.

He can't sell his house with a lein on it, no one will buy it that way.

The lein may just get his attention and get him to mail the funds back.

its been a long time but I seem to remember a button on the left side
of the Z1 that when you press it allows the rotary encoders to operate
as volume controls.

I like the personl touch of making my own. And I don't think it costs that much. Its just like building your own antennas rather than paying for someone elses wire.

R4B receiver works good, looks good, front panel very clean.
Electrolytic caps have been replaced, and it comes with many optional
crystals for shortwave, seems to be sensitive since I'm able to receive many
stations using a short wire for antenna. Comes with manual.
Asking $200.

You're going on the false assumption that many CBers *want* to
communicate. Around where I live, they simply want to trounce other
operators. I guess its a kind of nerdy ego thing. I learned a lot from
CB radio myself, but I don't hear any operators on nowadays with any
true value to add people looking to learn.

If you have a friend who also has an OPC-478 sub his cable into your setup. or sub your cable into his.

Since the OPC-478 has a level converter inside of the db-9 you might try sending a long data string with something like hyper terminal and monitoring it with a vom set to AC or a scope. You should be able to see some wavering on the vom or a data string on the scope. The output of the OPC-478 is the ring and the ground is the sleeve.

Hey Larry, Den Phillips here, (G0-DGP), den0552@cwnet.com I have yet to take up my reciprical liscence in the US, but due to medical condition now seems to be a good time. Can you give me a little more info on your rig. When you get to my age the ole memory cells ain't what they could be. My last transiever was a Yasoo FT102 Hybred and boy did I weep when I had to part with it. Looking forward to hearing from you.73s

Looking for a Johnson Navigator c.w. transmitter.
I'd prefer to buy one that looks good and works
well, rather than a fixer-upper (I have enough ham
radio projects already!) but I will consider all.
Whatcha got?

73,
Dean K5DH

3597. Re: Low Cost QSL cards

Newsgroup: rec.radio.amateur.equipment

Source record: 31426

I priced card stock paper with perferations for index cards. Typically there are 2 cards per sheet due to the size (4x6) although some are designed with smaller cards and have 4 per sheet. The typical package contains 10 sheets. Thus you get 20 cards (or 40 with the smaller cards). The typical price is about $20. This means you can get 100 (200 of the smaller) cards that you print or you can buy 1000 cards already printed for you for less than $100.

Which do YOU think is the better deal? This doesn't even factor in the cost of ink and wear and tear on your equipment.

BSSSST

http://www.hamstuff.com/

has packs of 100 for 13 bucks, thats 400 cards.

And I can personalize each one and as I add/subtract stuff I can change
it. I use different cards for DX than I use for County Hunting. With
1000 cards Im stuck with 1000 cards that I can never change.

Add Price for Ink and I still havnt hit 100 bucks, I typcially get 300+
per color and lots more with B/W.

Hi Hans
-
In typical motorola form... use the last 4 numbers for the type and search for your cross using said. So in short, you have 9686 transistors. They can be ordered direct from Motorola parts using the number you have and they can be sometimes crossed from the M9686 type part number. If you told us/me what it was for, I could probably help you out more. Just post your reply here and I'll see it and reply when I get back.

Source record: 31432

I have an Alinco DR 570 that on the UHF band I do not get a full quietining of the audio. When I apply an unmodulated signal from a caliberated signal generator the normal hiss will only drop to abut half the level it normally is instead of going full quietning with a large signal. The VHF side works fine. The sensitivity is about the same on either band to break the squelch and the smeter comes up about the same. When I modulate it , the VHF side is fine. The UHF audio is not that loud but it stillhas a big ammount of hiss in it. Any ideas as to where to look ? It seems that it must be something in the stages after the "discriminator" and squelch circuits as the squelch acts normal.

From what I have heard on my recievers is more of a white trash testosterone expression, overgrown kids who need to make up for the lack of testicle and penis girth through the purchases they make to represent themselves. Typically these are the type that believe that professional wrestling is real, bet on tractor and truck pulls and nascar races, and think skoal and busch beer are part of the four basic food groups.....

A nerdy ego thing would be more like these kids that are hackers. Only difference is one is hiding behind a keyboard and one is hiding behind a mic.

3611. MFJ-4245MV crowbar problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-15 04:27:17 UTC
From: Tidris <nospam@nospam.come>
Message-ID: <140420032126319778%nospam@nospam.come>
Source record: 31444

I am trying to use an MFJ-4245MV switching power supply with a DC to AC inverter. The power supply crowbar kicks in as soon as I turn the inverter on even though the inverter has no load. I am reasonably sure the inverter is not defective because it works fine with a different non-MFJ power supply as well as directly from a 12V battery. It seems the inrush current when the inverter is turned on is triggering the overcurrent protection in the MFJ power supply.

Does anybody know how to modify this supply so it can tolerate the inverter's inrush current? I realize the current protection is there for a reason but I would like to be able to temporarily disable it or at least make it less sensitive when using the power supply with the inverter.

You're using a switcher to go from mains voltage down to DC, and then
an inverter to go back up to AC, and then running your equipment off
of that AC? Curious... :-)

Might be better to modify the inverter, to reduce its inrush current.
Adding a negative-temperature-coefficient inrush limiter would do the
trick... these are very commonly used in switching power supplies to
keep the inrush from tripping the breakers or browning out other
devices on the same circuit. I see that the MFJ has two such in its
input circuitry, between the fuse and the T1 filter/choke. Similar
devices can be used for a high-current 12-volt input, such as your
inverter has.

I want to run the inverter from the 40 Amp switcher for testing
purposes only. My other power supply (without crowbar problem) is only
8 Amps so it can't run the inverter anywhere close to its rated output.

> Might be better to modify the inverter, to reduce its inrush current.
> Adding a negative-temperature-coefficient inrush limiter would do the
> trick...

Interesting. Can you suggest a part that would produce a negligible
voltage drop in the 13.8 V circuit after it warms up with a current of
45 Amps?

I was thinking it would be possible to change the time constant in the
switcher crowbar circuit so it takes longer to kick in, long enough to
let the inverter settle down to a current under 45 Amps, but not so
long that the switcher burns out in case of an output short circuit. Or
perhaps it would be possible to add a switch that would allow me to
disable the overcurrent protection altogether when working with the
inverter, and of course being extra careful not to create a short
circuit when the protection is disabled...

> circuit when the protection is disabled...

In response to my own post, I found a way to deal with the crowbar
problem. Disconnecting one side of R28 makes the overcurrent protection
non-latching and this allows the inverter to run. Apparently the real
problem wasn't that the power supply was protecting itself from a brief
overcurrent condition but that once the protection kicked in it would
latch on until the power supply was turned off.

I haven't extensively tested this modification so use at your own risk.
In particular I don't know if the power supply will still be able to
survive an output short circuit.

3627. FS: Kenwood TR-7950 2M Rig

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-15 19:12:52 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <UQYma.26150$4P1.2355944@newsread2.prod.itd.earthlink.net>
Source record: 31308

This Kenwood TR-7950 is in good working order but lacks the power cord and mike. I tested this radio for receive and transmit and it does both fine. This radio would be an excellent spare to someone who already has the mike (7 pin). Cosmetic condition 7. Not pretty but fully functional.

Only $50.00 plus shipping. I'll buy the box.

This classic Heathkit HF amp is in very good condition cosmetically. 8/10
condition. Some minor chips around the edge of the front panel caused from
removing the outer cabinet.
This amp has:
Full output from two 3-500 tubes
Harbach soft-key mod for use with modern solid-state transceivers
Harbach meter board replacement with meter protection and heavy duty diodes
AG6K (Rich Measures) mods
New feet

Asking $525.00 plus professional boxing (professional foam packing to assure
it won't arrive broken) and shipping/insurance costs.

Don't do it. It's a waste of money at any price.
You can build a more effective noise bridge yourself for cheap.

MFJ made two antenna analyzers. One was the "simple noise bridge" and
almost next to useless. The other one had the signal source and was rather
complex. It worked very well for what it is.

You may want to use a call sign database, and verify that the address
you used matches the one in the FCC database. I'm sure that at times
call signs are used by someone else in this context.

There are possible problems with email. Try a snailmail or phone, a
different contact method.

Something you might have wanted to do before sending money would be to
have Googled the newsgroups on his callsign.

I expect you want the MFJ259 analyzer. It's quite a good stuff, but
the RF-1 Analyst can do nearly the same job for half the price.

Glad it all worked out.

Fortunately, you had the good judgement and patience to try to resolve
this and research it, prior to calling in the National Guard and
hosing the seller's reputation needlessly.

A note to people shipping items:
In this day of instant emails, faxes, and overnight delivery,
expectations are for rapid shipping.

Heard rumors about a new Kenwood mobile that comes in two versions,
100 watts and 200 watts.

And a new Kenwood with a scope display to compete with the big Icom.

Any truth?

Bob

The pot value appears to be 10K ohms. The service manual doesn't say
what the taper is. The Icom p/n is 10KAK09111 (not sure if that's
supposed to be all one string or not - the squelch pot has
"10KBX2 K0921F20" in the same field).

Thanks to the manuals now being online I was able to find this answer.

Look at page 27 of the IC-2720 operators manual. It allows you preset
the offset amount.

Generally what ever is left in the set mode becomes the default for
the transceiver. If you require some odd offset, then program that
requirement into a memory channel and return the settings in the set
mode to the 0.600 and 5.000 you desire.

fer gawd sakes, don't buy an OPC478!!! it is *way* too expensive,
and a ripoff for what you get... get a ct-29a at rstars.com - only $25,
and it works with a wide range of radios!

If it isn't broke why fix it? New would be nice, but there are so many
older models (450's 850's 570's, even the 830S's) floating around. It would
be nice to see a Kenwood HF mobile with detachable head unit though!!
Kenwood, are you listening?

I doubt it. Not much money nowadays making ham radios. No younger hams
just old conservative guys tight with the money. No growth in ham radio
anymore. I think the internet has taken it away.

> ham band.

Why in the Multiverse would anyone want to pollute ham frequencies
with something like a baby monitor?

Assuming that doing so would even be legal under Pt. 97...

Of course its legal you guys are smoking something thats why you are a ham.
To experiment. Just like its legal to convert a cb to 10 meters or convernt
high speed computer links to use for ham links.

I've got a really rare McKay-Dymek DR101 shortwave receiver.
For some time I've been looking for an owner's manual and/or service
manual. I've gotten manuals for the similar DR22 but the tuning and
synthesizer section is different on the DR101.

None of the usual manual sources, including any of the online outfits,
have anything for the DR101.

Does anyone out there have a manual?
I suspect that only a couple of hundred of this model were made and
only another owner may have a manaul.

tnx,

Doug

On the one hand, it is quite legal to use modified or
built-from-scratch equipment on ham frequencies if you are licensed as
Technician or above.

On the other hand, you are responsible for making certain that there
are no spurious emissions that would interfere with other users or
equipment on any frequency.

Experimentation is part of the hobby.

Carl,

I've had a lot of experience troubleshooting the Astro-150A series.
I don't know why the other poster said that it doesn't cover all of
ten meters. The band coverage for 28 MHz extends well below and above
the 10 meter amateur band.

There are two things to check.
The most common reason for sythesizer malfunction is a bad tantalum
cap on the major loop pcb. This is the board that is hardwired
on the top right side of the rig. I think the cap is a large value,
around 22 MFD tantalum, at least large for a tantalum. They go bad
frequently and the synthesizer won't lock up properly.

The other problem is related to the microprocessor board, buried in
the heart of the rig.
There are a series of CMOS chips that act as variable dividers for the
synthesizer loop. I've had one or more of these chips go bad.
The result is that the diviser ratio is incorrect and the rig locks on
wrong frequencies that do not correspond to the fornt readout.

I've found that by using a logic pulser and a scope, examining the
gate actions of each of these chips. It takes a bit of study.

Doug/WA1TUT

Well, after being told we're OK, now I'm being told we stand at NO-GO.

SO.... yet again, I still need four sets, HIGH POWER ONLY:

A4 head and cable WITH compatible:
DEK
Light Control Head
Microphone
Speaker
Jumper cables for DEK, etc.

I need all these items from the same source please, I cannot source from 12 people, it's just too intricate of a plan to deal with. I also cannot purchase anything that requires "mods" or "adaptation", per customer request.
Please, if anyone out there that isn't a cutthroat can offer this equipment, I would GREATLY appreciate it!!
thanks and sorry for the continuing saga...

PLEASE EMAIL DIRECT,
thanks,
Randy

Self-contained desktop HF linear amplifier capable of continuous operation at input powers in excess of 2 KW PEP/SSB and 1 KW continuous carrier with no time limit.

Manually tunable from 1.8 to 29.7 MHz.

Four bandswitch positions provide NO-TUNE-UP operation at full legal power on the 80-15 meter bands.

High-speed QSK break-in operation.

Export model has a tenth position that provides no-tune-up 10 meter operation. Operation may be broadly peaked for optimum efficiency across 28-29.7 MHz using the front panel load control.

A sub-band selector switch selects optimum no-tune-up arrangement for either CW or Phone, 80-10 meters.

Three Eimac 8874 ceramic, grounded-grid triodes, air-cooled. Full output power. Wired for 220V.

This low-time unit is extremely clean both inside and out. The suede front panel is in the best condition I've ever seen. No wear around the dials and switches as is usually found on this model.

One-owner unit. Serial #8637. Original factory manual/schematic included.

This unit will be professionally foam packed in two cartons. Transformer shipped separately. 70 pounds shipping weight.

Asking $1750.00. Buyer pays all actual packaging/shipping/tracking/insurance costs.

3697. WTB: IC-745 options and parts

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-18 10:24:13 UTC
From: Dan Dav <dadavdav@hotmail.com>
Message-ID: <3e9fe407$0$24666$edfadb0f@dread14.news.tele.dk>
Source record: 31378

If you have the IC-745 options IC-EX243 and IC-EX241, and are keen to sell them, then drop me an e-mail. Also interested in disfunctional units for parts.

thanks
Robin

3701. FS: Wehrmacht FuG16 receiving unit

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-18 15:08:14 UTC
From: arnoldg@c2i.net
Message-ID: <3ea0155a.416546@news1.c2i.net>
Source record: 31383

Hello,

I have for sale the receiver unit from the German WWII FuG16
transceiver system. The complete unit has a transmitter unit, a
receiver and a control unit. The frequency is 38,5 - 43,2 Mhz and the
receiver uses 9 pcs of the RV 12P2000 valve and 1 voltage stabilistor
valve. It is very well and compact built, and truly a beautiful item.

I receiver unit I have for sale is in very good condition (I would say
nearly mint) and a picture is available. A copy of the complete
handbook is inclusive.
This is not a cheap unit, but I am also interested in other German
WWII receiving and transmitting equipment, so maybe we could swap?

Regards,

Arnold Goksyr

Instead of tinkering with baby monitors, why not run an FRS radio as the exciter feeding into a frequency doubler? The 2.5kHz narrow-band deviation will become the 5kHz standard as used in Ham F3 voice transmissions. Also, if you double the frequencies of FRS channels 1 through 7, your outputs will range from 925.125MHz to 925.425MHz. This falls nicely into the 902-928 spectrum which has a secondary allocation for Ham use. Channels 8 through 14 however would land you out of band, and as such, would be a violation of our licensing. However, 7 cheaply accessible frequencies would be nice, as well as help keep a presence of some sort on the band. As far as receivers go, the simplest would be to use a secondary receiver, but if you're feeling in need of a homebrew fix, an outboard frequency divider would keep you busy for a few weekends.

Uh, wouldn't he then need a high gain 900 MHz amplifier to get the received signal up to where it could drive the divider? And what about the horrendous intermod that would generate? The last time I checked dividers were not very linear.

My vote would be for a an oscillator/mixer combination.

3709. Swan 700cx - Some Questions

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-19 00:56:20 UTC
From: Dave <dave@somewhere.net>
Message-ID: <ij71av0pag9j0ql4e6jp5gousgi2bdcjvk@4ax.com>
Source record: 31391

Howdy,

I just bought a really nice Swan 700cx from a friend of mine who is leaving the country. It came with the 117xc power supply and a Model 508 VFO. It also has the original Shure mike and a Silver Eagle.

I've never owned a tube transceiver before so I'm going to have to learn how to use it properly. I have a couple of questions that maybe someone could help me with.

1. The 508 VFO plugs into the accessory socket on the back of the radio. To use the radio WITHOUT the VFO connected apparently requires a jumper plug to plug into the accessory socket. This apparently has been lost and I can't find a diagram for it in the manual. Does anyone know what pins need to be jumped to allow use of the radio without the outboard VFO?

2. I understand that the 8950 tubes are hard to come by. Maybe I should buy a spare pair while I can. Where can I get a matched pair?

3. The radio seems to operate perfectly except that there is an intermittent hum (quite loud) (60 cycle?) through the speaker. It comes and goes by itself every few minutes but sometimes if I tap the radio It will go away for awhile. Does this sound like bad caps or what? Could it be in the power supply?

I've got to tell you that I am really surprised how good this radio sounds on receive. It actually seems to have better audio than the Yaesu FT-990 that is my other radio. I would like to get the little problems ironed out with it and use it.

Any help would sure be appreciated.

Thanks,

Dave Alden WK8F dalden@comcast.net

Sure, but I reiterate, a separate receiver would be the simplest. Secondly, the problem with using an LO to bring the rx frequency down is it would necessitate further processing to reduce the deviation of the rx'd signal. I do however, see your point on the intermod issue, so it's decided; we'll use outboard receivers... :)

www.Jameco.com

You would have to match the old relays to the hundreds of models they have in stock, but it could be done, for a lot less than Yaesu charges for the upgrade kit($40).

3718. Re: MFJ-4245MV crowbar problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-19 15:39:33 UTC
From: fmmck@aol.com
Message-ID: <20030419113933.18914.00000216@mb-m16.aol.com>
Source record: 31250

<< In response to my own post, I found a way to deal with the crowbar problem. Disconnecting one side of R28 makes the overcurrent protection non-latching and this allows the inverter to run. Apparently the real problem wasn't that the power supply was protecting itself from a brief overcurrent condition but that once the protection kicked in it would latch on until the power supply was turned off. >>

Tidris-

It may be far-fetched, but I would worry that there could be a cycle of events where a high current pulse would cause a brief shutdown which would recover after the end of the pulse, which would shut down again with another pulse, et cetera. The average current of this pulse train might exceed a component's capability.

I have the same problem as yours, but with the MFJ-4225MV. I'm testing a Radio Shack 300 watt inverter. I wanted to determine its efficiency by using the power supply's meter to measure current. I tried bridging the power supply output with a large capacitor, but the largest I had at hand was 4500 microfarads, which didn't make any noticeable difference. If I can find it, I'll try one that is about 50,000 MF.

I also have the Radio Shack 25 Amp switching supply that I picked up for $60. It runs the inverter without a glitch. I loaded the inverter to 300 watts, and ran it for 30 minutes. About that time, I realized it might draw a little more than 25 Amps, maybe about 29. The power supply was starting to get quite warm. The fuse was definitely warm, but there were no obvious ill iffects.

Regarding the 25 Amp supply, I found I could pull off the plastic terminal caps and cut-off the metal ends of the terminals with a Dremel cutting wheel. That allows me to completely remove the terminal nuts and use 1/4 inch ring terminals.

One negative feature of this supply, is that I can pick it up on the HF radio using a nearby whip antenna. It might not be a problem if the antenna was outside.

<< Kenwood has nothing planned. No new models for amatuer market. Just the same old tired stuff. >>

M.E.-

I suspect you are right. However, that isn't what the Kenwood rep said at the last two Orlando Hamfests.

Last year the word was there was a new rig coming by the end of the year, possibly to be shown at Dayton.

This year the word was there was definitely a new rig to be introduced at Dayton. It was to be a "large mobile", somewhere between the size of the TS-50 and the TS-570/2000.

The recent rumor mills have been silent. The new Ham Radio magazine mentions several brands with new models to be introduced at Dayton, but not Kenwood. I think the Kenwood rep may have been just trying to get people to put off buying an Icom or a Yaesu. I'll believe a new model when I see it!

> someone elses wire.

Agreed, and you can do some gorgeous graphics using today's ink-jet and
laser printers.

As for card stock? If you need 8.5x11" sheets of it, they're available
at any Staples. Another option is to find old manila file folders that
are headed for the trash bin, and use a paper cutter to trim them to
8.5x11" size, then feed 'em through the printer.

Check the printer manual, though, before using cardstock -- some
printers are less able than others to use cardstock, others require that
you make certain adjustments. My LaserJet 6L, for example, does better
with cardstock if you flip the switch to feed out the front, rather than
into the paper catcher. Puts less curl on the paper, for one thing, but
it means you have to be there to catch the paper as it comes out.

YMMV ;-)

... which I found in a list at http://www.nicholson.com/rhn/basic/,
which lists quite a massive number of other BASIC interpreters which
are available complete with source code. Many are freely
distributable under the GPL or LGPL.

There ought to be one there which will handle most of the dialect of
BASIC you used, I imagine.

What type of Basic ? If it was MS Quick basic, just use an old copy og
Quick basic
in a DOS window.

If you do not have a copy og QBasic, download it here
http://download.microsoft.com/download/win95upg/tool_s/1.0/W95/EN-US/olddos.
exe

> someone could help me with.

One thing, is NEVER tune for 30 seconds at a time. Usually, when you first
set the Plate and Grid, you will notice an increase in receiver volume.
Once this is done,
then set for "tune" for about 15 seconds and let go. You never want the
finals to turn
cherry red (orange); you will quickly flatten the tubes OR burn out your
filaments. Just
tune plate and grid, count to 10-15, and pause to let the finals "rest" for
a bit, Then repeat
the process. Sadly, would you believe that I sold a 700CX manual at a
hamfest just today?
I *may* have a page of instructions if I can lay my hands on it and send it
as an attachment.

>
> 1. The 508 VFO plugs into the accessory socket on the back of the

> anyone know what pins need to be jumped to allow use of the radio
> without the outboard VFO?

I also may have one of those plugs--I'll have to look around. I got rid of
most of
my Swan gear several years ago. That plug also also allows one to plug in a
crystal
oscillator if you happen to run across one.
>
> 2. I understand that the 8950 tubes are hard to come by. Maybe I
> should buy a spare pair while I can. Where can I get a matched pair?

RF Parts used to have some, but the price I last paid was $90/matched pair.
You might

check with Svetlana(?). I've not had to mess with tubes in a few years.
Those things ARE
scarce IF you and find them at all.

> 3. The radio seems to operate perfectly except that there is an

> what? Could it be in the power supply?

Do you tap the radio or the supply? Could be caps breaking OR, again
tubes. AC transformer? hard to say--someone else might add to this......
>
> I've got to tell you that I am really surprised how good this radio
> sounds on receive. It actually seems to have better audio than the
> Yaesu FT-990 that is my other radio. I would like to get the little
> problems ironed out with it and use it.

The Swans WERE/Are good rigs in their day, and most tube rigs had
a sort of "warm" sound and quality audio. One thing in using a Swan.
Turn the rig on about 30 minutes or an hour before transmitting and all
the filaments to warm. Everybody says Swans are notorious for drifting;
and they WILL drift if you turn one and starting talking right away. Those
not raised in the tube era often don't know about this and get fussed at as
operators
chase the QSO up and down the band. Using a Swan, or ANY tube rig, will
drift
if you start talking right away, and they seem not to settle down until you
quit and let
thing settle down for quite some time. Let a Swan "cook in" at first and
they will often
stabilize and not drift at all. Just don't tell anyone you are using a Swan,
else you will be
told you are drifting to the moon! Hehe! I've let my Swan 700 settle for an
hour, or less,
and hardly had any trouble.

I'll snoop around and see if I can find the instruction page for the 700
and/or one of those
plugs.

If you're looking for QBasic, it can be had on most Windows CDROMs
(except XP) here \OTHER\OLDMSDOS or here \TOOLS\OLDMSDOS

Also, it can be downloaded from Microsoft's site. Check
http://www.libertybasic.com/qbwindowsfaq.html for instructions and
other useful QBasic and Windows tips.

Or, if you'd like to try a Windows BASIC instead of QBasic, check out
our Liberty BASIC software.

-Carl Gundel, author of Liberty BASIC
http://www.libertybasic.com

What match are you talking about? The amp is a tuned input. If you are looking for a amp interface to protect the xcvr keying circuit, there are many available. Several always for sale on ebay. Ameritron makes an interface, the Yaesu FRB-57 (think that's it) is often available used also.

From: Toscano <toscano2@ix.netcom.com>
Message-ID: <b7v6hbajt1@slb2.atl.mindspring.net>
Source record: 31279

I recently obtained two 2-channel UHF P200s. I am wondering if it is true that my removing the "stopper" ring on the channel selector dial (little prong that limits the radio to two channel positions and opens it up to six positions), if I have those six positions, can I then get the radio programmed for six channels? I noticed after making the mod to one radio that the two existing channels repeat each other in the positions for channels 3 to 6.

Thanks!

Need to clear out some radios - so I can buy some new ones ;>)

Kenwood TS-520S Station: $275
Includes: TS-520S Trasceiver
VFO-520 Remote VFO
One spare set of balanced finals.
Yeasu Dynamic Desk Mike
Add-on Digital Display (Not DG-5)
Has User and Service Manuals.
This transceiver works very well and still transmits
a good 100 watts into a dummy load as measured by a Bird 43
watt meter.

Alinco DX-70T Transceiver: $325
Includes: 15 foot Separation Cable
Hand Mike
Has original box & User Manual
This transceiver works very well and transmits 100 watts
to a dummy load as measured by a Bird 43 watt meter. 6 meter
transmission was 9.7 watts.

Icom IC-Z1A 2M/70CM HT with Maha 45 Watt Docking Station/Amplifier: $250
Includes: Two BP-173X, 9.6 volt/1000Mah Nickle-Metal Hydride
batteries - these are the ones that don't develop memories.
Has all User Manuals
HT transmits 5 watts with charged batteries on 2 meters
and 3.5 watts on 70CM.

All equipment is offered "As-is" to protect myself from
golden screwdrivers.

Thanks for your reply. That is what I thought I did but the 440 freq
are showing a .600 offset and it takes forever to get to 5.000 since
you can't key the offset directly. I have tried to reset the channels
back to 5.000 and when I key it is correct but when I save the channel
then it is back to .600. Icom missed the boat on this. Easy to
change/set on my Yaesu's.

HI:

WTD=>Scrap Saber / MTS / XTS / HT1000 Mic Connectors

Do you have some of these " Old Scrap " mics?,
I am in need of " Any " quanity of the Saber, XTS,
MTS2000, HT1000, MT2000 Series Connector heads.

Any Condition, working or not.......All I need is the
Cord, but will take the whole mic too

Let me turn that Old Stuff collecting dust into
CASH or Trade.

Please email me with what you may have.

Will pay shipping too, if needed, I will even
send a Self Addressed Prepaid Envelope to
you

Monty

What side of the radio are you programming the UHF on? Though I would
think you could program memory channels on either side, you might have
to accomplish that on the factory default UHF side.

They never supported direct keypad entry for offset tuning. But it is
simple enough to tune and generally the MHZ tuning function can be
used also.

If you are trying to rewrite the memory channels make sure you go into
the set mode Before you rewrite the memory and change the offset as
the transceiver uses that setting for memory channel writes.

If you write the memory channel back to the VFO the offset amount is
also wrote back. So if you set the offset to 5.000 first, once you
write a memory channel that is carrying a 0.600 offset back to VFO,
the set mode will change to that offset.

What ever is easier, write the memory channel back to VFO, change the
offset to 5.000 and rewrite it memory. OR just reprogram the memory
channels with the correct offset.

If the offset is still 0.600 on UHF when you write it to memory. I
would send an email to Icom, something is a miss there.

3761. TM-D700 control head connector (RJ-22)

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-21 13:54:35 UTC
From: jbeadles@pobox.com
Message-ID: <1507cc49.0304210554.3ee4c255@posting.google.com>
Source record: 31292

I'm in the process of installing my TM-D700 in my truck, and I'm working on a somewhat neater cable install than I usually do. I don't want to run the factory control head cable, because I want to be able to run the control head to the back of the truck for events and don't want to have my only control head cable tied up.

So, I'm trying to build my own cables, running from the radio to an RJ-11 jack in the dash, then using a short (18") patch cable from the dash to the control head. However, I'm having a bear of a time crimping the RJ-22 connector that is used by the control head. An RJ-22 is the narrow connector that is used on telephone handsets.

Looking though all the local electronic stores, nobody has a cheap crimper, so I bought a cheap RJ-11 crimper and filed the two outside pins off. This modified crimper seems to work, in that it pushes all the pins in and I get continuity on both ends of the cable. However, only one of my cable attempts works, and then only if the end is wobbled around in the jack on the control head.

Anybody had any experience trying to do this?

3762. Kenwood TM-G707A Questions

Source record: 31294

Just got a new G707 and have a couple of questions I haven't found answers for in the manual.

1. The microphone backlight appears to be always ON. Any way to turn this off?

2. My band button toggles between 2m, 440, AND a 118-135 band. What's up with that? It's a dual-band radio, I expected it to toggle between 2m (with extended rx) and 440. The "3rd band" is a pain to toggle through. Anything I can configure to get rid of the 3rd band so it toggles between 2m (with extended rx) and 440 only?

73,
Ariel

FS: Tel-Link Radios (10-38GHz)

I have for sale 10 different, some pairs, tel-link 10, 15, 23 & 38 GHz boardband Microwave radios. They are in box, most of them. Two have splits that would make a pair at 10.5GHz. These are high quality with bandwidth from 5-40MHz allowing multiple T1 lines or 1 DS3 line transceive.. Photo upon request. Best price for some or lot. I have 12 total available.

3764. Hooking up 2 Meter Rig to Battery

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-21 17:08:13 UTC
From: "Keith D. Thomas" <bikealot@erols.com>
Message-ID: <o198av4hp3to49kgn6v94kve9s3lisqqkr@4ax.com>
Source record: 31296

I am installing a 2 Meter rig into my 1996 Grand Prix and am running into problems with the power hookup to the batter. I went to NAPA and got some "Extender Bolt with Accessory Screw Battery Accessory" to do this. Basically you remove the old bolt holding the battery wires and put this one in it's place. It then has a screw on the end so that other wires can be attached. This is the device they tell you to use on the GM documentation.

However, when I take the old bolt off to replace it, it seems embedded in a plastic case that connects it to the cable. So, I can disconnect if from the battery, but not from the cable.

The plastic case seems to be a one piece mold. I guess I could cut it open, but would hate to do that and then flunk the PA annual car inspection.

Any ideas?

Thans..Keith

That's sort of like comparing Ford and Chevy. I happen to prefer a
Chevy--doesn't make one
"bad" or "better" than the other, it is a preference.

So it is with radios. Look at the two radios, compare features, look at the
drawbacks to each one,
and choose the one that comes closest to the parameters you have set. They
are good radios.
I chose the 706 because it meets the standards for NTIA compliance where the
Yeasu does not.
Had that not been an issue, I would have gotten the FT100D.

Good Luck es 73

>Just got a new G707 and have a couple of questions I haven't found
>answers for in the manual.
>
>1. The microphone backlight appears to be always ON. Any way to turn
>this off?

Haven't seen one. I suspect they've just hardwired a low-current LED
to the microphone power line. You could _try_ turning off the display
backlight and see if it affects the microphone, but I rather doubt it.

>2. My band button toggles between 2m, 440, AND a 118-135 band.
>What's up with that? It's a dual-band radio,

Well, it's dual-band-transmit, three-band-receive. The third is an AM
(normally) aircraft/public-service band.

> I expected it to toggle
>between 2m (with extended rx) and 440. The "3rd band" is a pain to
>toggle through. Anything I can configure to get rid of the 3rd band
>so it toggles between 2m (with extended rx) and 440 only?

Perhaps so, but I doubt you'd want to use it. It appears possible to
change the radio from "USA/Canada" mode to "Europe" mode by removing a
resistor/jumper in the control head. I believe that this disables the
third band. However, it also would shrink the 2m and 440 transmit
(and receive?) ranges to those generally allowed in Europe, would
disable the automatic repeater offset feature (since this is
configured for the U.S. bandplan), disables direct frequency entry
from the DTMF pad, etc.

All of the other mods I've read about, will open the radio up to even
more bands.

Source record: 31200

I first installed this on a Cushcraft 6 element 70cm yagi. Without a rain loop at the antenna. I ended up with what seemed to be a gallon of water in my old Motorola Syntor. I re-did the install (same antenna) with a loop at the antenna. It loops 270 degrees. I also did a far better job of sealing it. I used coax seal (tar tape) and good 3M electrical tape. I did not replace the feedline. Though I do have a roll if I need to. I figured this would solve my problem... Wrong! I think I have a worse water problem than before. Connector at the antenna feed point is an SO239/PL259. I'm not doing weak signal work. I just want to hit a few of the UHF repeaters in my area with this old rig. Anybody got any suggestions?

73,
Ed KA9EES

What you have done changes the radio from 2 to 6 channels
mechanically, but the programming will have to be changed now to
incorporate new information in channels 3-6.

I had an unexpected break at work and was able to run over to NAPA.
They explained how it do it using a small screwdriver to get in there
and work the old bolt out. It took about 20 minutes but I got them
both exchanged, and the car still starts.

Now..Iam working on getting the wiring through the firewall. On the
passenger side under the carpet there seems to be a large rubber seal
with a flexible hose holding wires. I started to see if I could
remove it and get my wires through there as well. It was wet when I
began to pull it out. So now I am not sure if that is the best way to
get through the firewall.

Does anyone have experience in running power cables through a firewall
in a Grand Prix?

Thanks..Keith

I wouldn't make any new holes in the firewall in a GM vehicle again, speaking from experience. I have a Yaesu FT2600M mounted in my 98 Monte Carlo and I ran approx. 12 gauge wire to the battery thru an existing hole by the brake pedal (not sure exactly where without looking). Fused it both in the cabin and by the battery.

Good luck!

I usually take a piece of coat hanger to use as a probe (file the end
so it isn't sharp) and poke it around where other wires run thru the
firewall. When I find a spot where it will go thru, then I make a
small flattened loop on the end, attach my wires, cover with tape to
make it smooth, and pull my wires thru the opening.

3776. Swan 700cx - Thanks for the help!

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-22 01:16:32 UTC
From: Dave <dave@somewhere.net>
Message-ID: <6u59av4t5fkpk99454pu2fnmv4e145chnh@4ax.com>
Source record: 31208

Thanks for the great response to my questions about the 700cx I just bought.

I was able to make a couple of jumpers to short out pins 1&8 and 3&4 on the accessory socket and can now operate without the outboard VFO.

As far as the hum problem: I took out all of the tubes and cleaned the sockets and pins. I tightened up all screws and nuts on the chassis. I cleaned the contacts on the power supply cord. And most importantly, I ran a 3/8" braided ground wire from the power supply chassis to the radio. ZERO hum now.

I also cleaned all the contacts on the rotary switch for the bands. Boy is that a scary switch. I'd hate to think of replacing that thing! Has anyone heard of some kind of contact plating compound that is supposed to plate the contacts with silver?

I was wondering if it is OK to switch bands while the radio is powered up and in receive mode or would it be better for the life of the switch to power down before switching bands?

I think that I'm going to replace the speaker in the power supply with a better quality one. The old one looks pretty dried out. It looks like about a 4" speaker and according to the manual it is probably 4 ohm. The radio has so much audio output that I just have to crack the RF Gain knob a hair before the volume is too loud.

I still can't believe how good this radio sounds. It takes a while to get used to tuning a SSB station in because the knob is so sensitive (compared to my Yaesu). But, the clarity of the signal puts my Yaesu to shame. The Yaesu sounds absolutely muddy compared to the Swan.

I haven't gone on the air with it yet but now that I have it cleaned up I'm going to practice tuning it up and have a go at it.

Thanks,

Dave WK8F dalden@comcast.net

http://www.caswellplating.com/

Haven't yet tried one of their electroless (or electrical) plating kits, but I'm tempted to - I have an antenna tuner with a roller inductor that could use a touch-up.

>I was wondering if it is OK to switch bands while the radio is powered
>up and in receive mode or would it be better for the life of the
>switch to power down before switching bands?

If the bandswitchjust changes taps on the inductor, then there really shouldn't be any significant AC or DC current flowing through any of it when in receive mode. It should be safe to change settings with the radio powered up, and it'll be easier on your tubes.

By the way, Dave - your use of "dave@somewhere.net" as a posting alias has a nasty side effect that you may not be aware of... at least, it does on my system. "somewhere.net" has a bogus IP address of 0.0.0.0, and for some reason this ends up being treated as a loopback address on Linux (it's equivalent to 127.0.0.1, don't ask me why).

Net result - when I tried to send you the above message via email, it looked right back around to my own system, was accepted, and another delivery was attempted. My system's mailer and disk went semi-crazy for about 30 seconds, until the 17-hop message limit was reached.

This classic Heathkit HF amp is in excellent working condition. Cosmetically 8/10.
Some minor chips around the edge of the front panel caused from removing the outer cabinet.
This amp has:
Full output from two 3-500 tubes
Harbach soft-key mod for use with modern solid-state transceivers
Harbach meter board replacement with meter protection and heavy duty diodes
AG6K (Rich Measures) mods
New feet
Asking $525.00 plus professional boxing (professional foam packing to assure it wont arrive broken) and shipping/insurance costs.

I cannot speak in model specific terms, but in general you may be able to pass the wire through where the steering column goes through, near it that is. Also there usually is grommets available too, to go through.

Last resort is to drill a small hole to get through, being extremely careful not to go through something on the other side that might be important. If you do this, run some extra wires for future use for other devices and just wrap and store the extra lines. Fusing of the line actually being used, at both ends is definitely a wise move. That way if the wire becomes disconnected at either end, and comes in contact with other wires, it will merely blow the fuse. If using the drill method, make sure to use adequate amounts of some type of sealant like RTV or silicone or whatever is appropriate for your vehicle.

When you do this, also consider taking the time to run ground straps from various parts of the vehicle to other parts. Definitely helps on the interference side of things.

I personally chose the drill method for my truck (12 years old now) and ran a huge bundle of wires for the various items I have operating:

2 meter amp
2 meter mobile
6 meter mobile
PA speaker wire
Siren speaker wire
Siren power leads
Overhead light bar
Dash-blaster light
Leads for headlight wig-wags
lead for 3 outlet cigarette lighter socket box for low current devices like scanners etc.

And still have a couple extra leads for future use as well. Granted these items are not all used at once, as that would be one hell of a current draw, but the project works for me.

Oh, I think that's decent advice, and I think that using an
anonymous/blocked nym for posting isn't at all a bad idea. It's
simply that the one that you chose, isn't the best one to use because
of the side effect.

You might want to use either "me@privacy.net" (an address which is
specifically intended as a "black hole" for all email - see
www.privacy.net), or "me@example.com" (a domain which is the
equivalent of a "555" telephone exchange, which will never actually be
assigned and has no email service). Either of these will quite nicely
deflect spamming.

I don't, personally, use a munged or anonymous nym when posting... but
I do spend a fair bit of time fine-tuning my domain's mailblocks, to
deal with the inevitable spam-attacks.

Source record: 31220

Hi all,

After about a year and a half my VX-5R seems to have developed a problem with the speakermike jack. This morning when I turned it on the audio was very quiet, even with the volume turned almost completely up. When I plugged in my speakermike the audio (from the mike) was normal. Then when I unplugged the mike the internal speaker went completely dead (the radio was still receiving). When I pressed on the rubber seal around the jack opening there was a crackling sound and some faint audio came from the speaker. Now, an hour later, the internal speaker sounds just fine.

I'm guessing that I've got a bad solder connection on the jack somewhere. Has anyone had any experience with this? It's probably not worth sending it in for service--that could easily run to a significant chunk of the HT's value, and I don't have the money anyway. If it is a bad solder joint I'd like to resolder it myself. Will anyone give me some pointers and caveats on getting the HT open and servicing it?

Thanks!

>Has anyone had any experience with this?

Might be a bad solder junction, or you might have an intermittent
speaker-disconnect switch/contact within the jack itself. If it's the
latter, a bit of contact cleaner/enhancer might help... or, perhaps,
the disconnect-switch metal might have fatigued a bit, and need to be
press-bent back into proper tension (carefully!).

A note about the plug and jack - Yaesu seems to use a unique type of
4-contact miniplug/minijack in the VX-* series. Although Mouser
Electronics does sell a similar miniplug (their part number 171-7435).
this plug is *not* identical to the Yaesu version - the ground portion
of the shaft is slightly shorter. As a result, this plug doesn't work
reliably in the VX-5. If you decide that the jack in your VX-5 needs
to be replaced rather than repaired, you may find that it's difficult
to find an exact replacement... the Mouser equivalent probably would
not work reliably with Yaesu-standard accessories.

> It's probably not worth sending
>it in for service--that could easily run to a significant chunk of the

Opening up the VX-5 isn't difficult. Remove antenna, belt clip, and
the battery. Remove the two Philips-head screws at the top of the
rear side of the case, and the four shorter screws inside the battery
compartment. You should now be able to separate the front and back
halves of the case. If I recall correctly, there are some small
screws holding the PC board in place, and some ribbon cables that
could be unplugged to allow separation of the components (but be very
cautious about doing this - don't unplug anything that you think you
might have trouble re-plugging!)

My project was a bit simpler than hooking all that up. Thanks to
someone who emailed me directly, an easy way to run the wire was
found. It was a good thing too, since I was going crazy trying to get
it through the spots that I found.

Thanks everyone for the advice and help on this. I am now able to go
mobile.

Ed,

I use a hot glue gun to squirt some hot glue in either end.

Make sure the spool of 9913 is stored with something over
each end to keep moisture out in storage.

For taping, use the rubber stuff followed by decent 3M tape.
A thread on taping technique comes up here every few months.

3799. KAM Enhancement Board / KAM EPROM Upgrade

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-23 04:29:14 UTC
From: Stuart Blake Tener <stuart@misty.com>
Message-ID: <b854rc$655$1@news.misty.com>
Source record: 31231
Cross-posted to: rec.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.ham-radio.swap

To whom it shall concern:

It has been years since I have played on packet radio, so I recently dug out my olde KAM, which by the way has firmware version 2.84!?! I am in desperate need for some upgrades for the unit!!! Any advice on where to get a firmware upgrade for a version greater than 2.84 would be very appreciated!

I am also looking for a KAM Enhancement Board!

I spoke with a friend of mine whom told me the firmware in the KAM is not public domain, therefore my understanding is that the only way I can ask someone to email me a copy of the firmware is if it a version that you paid for and are no longer using due to your unit being broken or a version you are no longer using that you paid for, since you have upgraded to a later verion of the firmware. I am looking for anything greater than 2.84, but 8.2E would be the most optimal to receive. I do own an EPROM programmer so an image is fine. Obviously if you are sending me the firmware via email, a notice indicative of your transfer of the license to me would have to be included with the image I imagine. I am trying to locate a copy of the firmware legally, though I suppose there is little I can do if someone just sends it.

The big problem is that Kantronics doesnt seem to want to help people with olde KAMs anymore, so I am left to my own devices to find what or how I can upgrade the unit!

Here are some of my questions:

What is the compatible version E2PROM (EEPROM) to use instead of a 27C512 EPROM?

What EEPROM/E2PROM will work to replace the 27C512 in the KAM?

Is 8.2E the latest firmware the KAM that I could have if an Enhancement Board is installed in the KAM?

What is the latest version of the firmware for the KAM that works if you do NOT have an Enhancement Board?

I understand there was a memory upgrade, can anyone tell me about that upgrade?

I also understand there was a clock upgrade, can anyone tell me about that upgrade?

Is there a place I can get a PDF or digital copy of the KAM manual, KAM Enhancement Board manual, or DVR 2-2 manual?

What can I do to upgrade or enhance my DVR 2-2 to make it work better?

Does anyone know what I must do to align or setup the DVR 2-2 if I want to add a second channel/crystal to it?

Where do I get crystals and of what type for the DVR 2-2?

Please carbon copy my email address on all replies if you can.

Thanks in advance,

Stuart

3800. Any AM/FM stereo W/ Priority triggered Transceivers?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-23 06:11:38 UTC
From: LoveLearn@iw.net
Message-ID: <56c2cb0b.0304222211.4fb6e8af@posting.google.com>
Source record: 31232

I'm interested to know of any AM/FM stereo receivers integrated into transceivers with priority triggered switching to transceiver operation by receiving any communication signal. Many people carry handheld business and similar communications transceiver radios on their belt loops. Many of these are normally turned on, ready to accept any selected frequency broadcasts. Probably 98 to 99% of the time these are on in listening mode, receiving nothing. During that 98 to 99% of their day, these users might enjoy listening to standard broadcast AM/FM stereo programing, perhaps using comfortable, light weight earphones. As an engineering exercise, it seems to me that it would be almost simple to build both classes of radios into a single chassis control selected by a priority switch triggered by received communications signals. Similarly, a voice mike triggered switch could instantly allow transmitting without manually selecting from the broadcast receiver section. Except when it receives communication broadcast or a microphone triggered transmitting demand, it would let the user listen to his/her favorite commercial radio or maybe even TV broadcast.

Do these exist? If no, why not. Any manufacturer reps listening? "Find a parade and get in front of it." This class of combination radios are obviously appropriate for many users. If they do exist, which seem to perform best?

Thanks for your consideration,
John

Give www.aade.com a try. He has several counters in the 50 to 70 dollar range, with programmable offset. He is using a TCXO as a reference for these units now, so a good unit is now even better.

Joe S.:

Unless I am mistaken, the only software and manuals they have on their site right now are for the KAM Plus and KAM XL. Those of us with the olde KAM do not seem to be getting the privledge of a software EPROM or manual to download.

Have I missed something, or did you find the 8.2E or other firmware for the Enhanced Board or KAM there?

absolutely the best idea... but sometimes these projects turn into
scavenger hunts... not too many folks have a max232 (IIRC) hanging
around, and if you throw in the time, effort, ordering time for
parts, and build time, making of the pc board, etc., one could
spend much more...

now if you have a fully stocked bench, OTOH...

:-)

I have had one of these scanners for years and never have had the
problem. I would assume that the radio will only hold the frequencies
for a short period of time if the batteries are low or the AC power is
not connected. There is nothing in the owner's manual about this.

At least one is available for a number of HT models from Yaesu, Icom
and Kenwood: the MFJ-284.

It is an earphone/boom mike, with a braodcast FM radio built in, which
shuts down when the ham signal is active in or out.

This may do what you are looking for.

You could order direct, or from any of the large ham radio suppliers.

Happy trails,
Gary (net.yogi.bear)

Hello all. I have a VX-5R HT that I will be using for packet. I tuned the local packet cluster and found that if I keep the HT in FM-Narrow, it sounds like the data is being "clipped". If it's in WFM mode, I seem to hear the entire data stream.

Does anyone have any experience using the VX-5R for packet? Any ideas on the NFM and WFM modes?

3813. Second overtone crystal for FM receiver

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-23 14:40:43 UTC
From: "Steve W.EE" <Use-Author-Address-Header@[127.1]>
Message-ID: <20030423144043.2649.qmail@nym.alias.net>
Source record: 31245
Cross-posted to: sci.electronics.components,rec.radio.amateur.equipment

I have an FM broadcast receiver which is fixed-tuned by
means of crystal.

It can receive from 88 to 108 Mhz. The model is McMartin
TR-55D, it also has circuitry to receive SCA, but what I
need is a crystal to change the FM broadcast frequency.

The local oscillator is 10.7 Mhz **below** the broadcast
frequency. The crystal frequency is half the LO freq.

For example I want a crystal to receive a broadcast station
at 93.1 Mhz, the LO would be at 82.4Mhz, the crystal would
be a 41.2 Mhz crystal.

I seem to recall that a second overtone crystal would be
required in this circuit. Is this correct.

The crystals I have for the unit measure 14mm x 10mm with
the 2 pins 5mm apart. It bears the number 41.700 (the
frequency), 04, and CC1.

Any advice on where and how to order one would be most
appreciated.

Thanks.

You find a crystal manufacturer, and order from them. You
give them the signal frequency you need, along with the
receiver's manufacturer and model, and any other information
you might have. Then they make the crystal for that receiver.

Now, the crystal place may not have the information. In which
case you look in the manual, where it's bound to provide information
on changing the frequency, and include enough info so you can
order a new crystal. If not, contact the manufacturer for
this information.

Michael

>NFM and WFM modes?

There are a couple of things which might be going on.

It's possible that your local packet-cluster system is driving its
transmitter too hard, and is over-deviating. You'd need a station
monitor, or an RF spectrum analyzer to see just how far out the
cluster node is spreading its signal. If this is the case, the only
good solution would be to ask the cluster node's operator to turn down
the deviation (or the audio drive into the transmitter) so as to
reduce the overdeviation and splattering.

You might be hearing a somewhat similar effect if you've got the VX-5R
receive audio cranked all the way up, when feeding it into your TNC.
On strong local NFM signals, at least, I've found that the VX-5
receiver can overdrive its audio circuitry... the audio waveform
coming out the speaker jack ends up being clipped. The clipping is
very visible if you monitor the output on an oscilloscope.

I suspect that switching to WFM reduces the audio signal output per
amount of deviation, and is thus eliminating the overdrive. A simpler
fix is to simply turn the VX-5 audio output down about half-way (and,
if necessary, turn up the input gain on your TNC).

Has anyone ever experienced interference to the receive audio in your radio when hooked up to a computer via the serial cable for rig control? The audio in the rig becomes very distorted when connected to the computer. Is this RF getting into the serial cable or something else from the computer that's causing this to happen? Any help or advice would be great!! Thanks all,....Jerry

>else from the computer that's causing this to happen? Any help or
>advice would be great!! Thanks all,....Jerry

It could indicate RF from the computer's motherboard or other
electronics, being conducted by the serial cable, and interfering with
something inside the rig (either direct RF pickup by the front end, or
interference with an IF stage). Computer serial ports really _should_
have RF suppression on them (e.g. ferrite beads, bypass caps, etc.).
in order to help the computer meet the FCC Class B emissions standard.
However, it's likely that a lot of motherboards omit these components
in order to save cost... and many PCs these days are assembled by
"body shop" companies who don't test the whole case/computer/
accessories combination for Class B compliance.

You might improve matters by getting a shielded serial cable, or by
clamping some RFI-suppression ferrites onto the cable as close as
possible to the computer.

It's also possible that you have some sort of ground loop, involving
the computer, the rig, the power supplies, and your wiring
arrangement.

Ditto. I've been using them for 30 years (amazing how long ago that sounds). Wouldn't go with anybody else.

There may or may not be a crystal oven associated with that unit. For some uses, you can do without the oven. If so, you may have to tell the company whether or not you want it to be used with an oven or not, and whether you need large pins or small pins. The large ones are the size that you'd find on an old 8-pin octal-base tube; the small pins are the size you'd find on a 7 or 9 pin all glass tube. They just solder the larger pins onto the smaller ones.

That is correct -- The only devices supported by the web page are:

KAM-98
KAM-XL
KPC-3+
KPC96/12

The KAM+ is no longer discussed or supported on their web page. I
left an email with their tech support to see if they have the latest
firmware or hardware for the KAM+.

We'll see if they even respond.

3823. Re: Any AM/FM stereo W/ Priority triggered Transceivers?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-24 00:32:21 UTC
From: LoveLearn@iw.net
Message-ID: <56c2cb0b.0304231632.c6e6f90@posting.google.com>
Source record: 31155

Thanks Gary Schwartz for providing the MFJ-284 with stereo FM external boom microphone add-on device suggestion. I found it at http://www.mfjenterprises.com/index.php

That's a big step toward a satisfactory solution for product I described. But it omits two important specifications. Like most people, I have two ears with which I prefer simultaneous use while listening to AM/FM (potentially in stereo) broadcasts. But the MFJ-284 has only one earphone. Besides, I'd prefer to select my own earphones, like audiophile-quality super-high acoustic isolation units by Etymotic (ER-6, ER-4), or the similar new Shure E2C earphones.

The second design omission is AM broadcast receiving capabilities. I tend to listen more to NPR and commercial radio "talk programs" which are often only available on AM rather than FM. I'd prefer designs which allow user choice of stereo earphones and include both AM and FM broadcast reception.

The MFJ-284 is an excellent external attachment which enhances various transceiver brands. But it only goes part way toward a full solution. Clearly the boom microphone is appropriate wearable hardware. Noise cancellation design should be an option for use in noisy conditions. Noisy conditions need not trigger the transmit circuit. And transmitted conversation noisy circumstances should allow noise minimizing as an option. It still seems to me that this should be built into some transceiver models rather than force customers to patch together outboard products. The same line of reasoning would apply toward high-end cell phone models.

Consider how many people run noisy equipment for hours on end. Farmers on tractors, construction equipment operators etc. Many of them have been advised to wear hearing protection plugs. A set of Etymotics or Shure in-ear phones drop ambient noise by over 20 db, just as do industrial grade ear plugs. If someone spends $10 to $25 thousand on a diesel mower, even they are candidate buyers for properly integrated transceiver and phone systems. The cost per unit of adding these capabilities to transceivers need not be much. As I understand it, single chip AM-FM stereo radios are available for integrators. That and a priority-use triggered switching circuit and external connectors would complete this proposed transceiver or phone package enhancement. Then, users could select their choice of earphones and wearable microphone, with or without noise cancellation capabilities. Normally, production costs are multiplied about 5 times by the time when ultimately reflected in MSR (list) prices. So maximizing integration where it helps most while minimizing required commitments to external

options seems to allow the least painful buying experience.

This class of integrated products will be available in 10 years because the need is obvious. What company will first fill this market opportunity if one of them hasn't already? I think people living for a single day with a system like this will be unsatisfied returning to less well integrated systems. Unlike automatic transmissions in vehicles, this won't reduce efficiency to improve convenience.

Still hoping it's currently available,
John

Thanks Dave....I have a new cable on the way with better shielding,
but I thought I better post a message on here anyway to see what else
I could be over looking. The "ground loop" here could be very likely
also. Most everything in the room is on the same electical circuit.
I'll have to try the ferrites also. Know of a good source for these
ferrites? Thanks, Jerry

Electronics Goldmine has some which look promising. Their item #G7771
is a pair of clamp-on ferrites (four halves, two complete sets, with
tie-wraps) for $1.00. You could buy a few of these kits, and maybe an
order of ferrite toroids as well, to make up a reasonable minimum order.
www.goldmine-elec.com is their web site.

Radio Shack has clamp-on interference-suppression ferrites too, I
believe.

This is "Flex" version. It's a foam dielectric. I think I may have a slit in
it somewhere. It's coming down anyway.

I think you are wanting a third overtone, even numbered overtones aren't possible. 41.2MHz is in the normal frquency range for third overtones.

A good crystal company that's been around a long time probably allready knows what sort of crystal that receiver uses. Call or email them about it. If they don't, they should be able to measure your existing crystal and make a new one on the right frequency.

Source record: 31163

Thanks for you suggestions. I current use this TNC hooked up to an FT-100D and it works just fine. Therefore, I think it's a setting with the VX-5R and not the TNC or the packet cluster itself. I will use the VX-5R in FM-W mode and see how it works.

Message-ID: <3EA7F451.B7F3BC70@nospam.com>
Source record: 31165

Just follow the hood release cable into the engine compartment, most of the time this cable will
pass on the same side as the battery (and ends up in front of the car at hood latch)

easy and you can cable tie the power lines along the hood release cable.

: There may or may not be a crystal oven associated with that unit. For some
: uses, you can do without the oven. If so, you may have to tell the company
: whether or not you want it to be used with an oven or not, and whether you
: need large pins or small pins.

I think the first poster said the crystal had two pins on it he gave the dimensions in mm but it looks to me like the pins are a little less than 1/4 inch apart. He said something like it being a second overtone I think he is wrong here. The circuit in the radio receiver might double the frequency from 41.2 to 82.4 but I am not sure what the overtone means here. I think maybe it means the crystal might be cut for something like 15Mhz but oscillate at 3 times its natural frequency at 41.2 then the receiver would double it to 82.4. If someone were to call up a crystal supplier ask for a 2 pin 41.2Mhz crystal is it likely they would get one like this? Being it's just an FM radio receiver I don't think they would have an oven inside it.

Hi all,

I have a set of Bencher BY-1 paddles that has developed a problem. The clear plexiglass (or whatever) paddle on the left is loose in its rivets. It's not too bad, but it wiggles a little and is starting to bother me.

Any suggestions on how to fix this? Just getting a new set is out of the question, as I haven't the money.

Thanks!

-Josh, AE6IQ

From: jbeadles@pobox.com
Message-ID: <1507cc49.0304240826.57719184@posting.google.com>
Source record: 31169

I'd appreciate any suggesions on a problem I'm having with two TNCs. I have a KPC-3 and an AEA PK-12, both that I bought 11 yrs ago, put up on a shelf and never used. I just pulled them out for APRS use at an event, and find that I can't connect to either one.

I'm using a known good cable (the one I use to connect my laptop to my TM-D700. Right now I'm just trying to use Hyperterm to get the TNCs set up.

I can't get the KPC-3 to do the auto baud rate detection. I can see it try do the auto baud detection, and I can see the proper config string when I force the KPC-3 to do a hard reset. I've verified that I'm using the right com parameters, and have attempted all three flow control methods and various bit rates.

The AEA PK-12 simply seems to be dead. I get no data from it. On power up, 4 of the control lights blink and go out.

I have replaced the lithium battery in the KPC-3, but the one in the PK-12 is soldered in and I don't have a solderable battery on hand yet.

Thanks for any relevant info.

> capability.

Now that you mention it, I created a repetitive overload situation with my 1300W inverter. The test load for the inverter was a 600W/1200W heat gun. At 600 W the inverter draws between 45A and 50A and the supply's current limiting was just begining to become active with a small cyclic voltage drop as a result. At 1200 W the inverter wanted to draw around 100A from the supply and the result was the supply quickly disabling/enabling itself in an erratic cyclic pattern, but no damage after a few seconds of that as far as I can tell.

An actual short circuit of the power supply output is something I have no intention of experimenting with, at least not on purpose.

My KAM-plus and KPC-3+ both work the same. You see garbage scrolling
until you suddenly see a legible message (I forget what it says). You
then have about a second to hit * then <ENTER>. That's near impossible
to do in time unless your keyboard has a seperate * key so do shift-8 to
get * first then jump on the Enter key when you see the legible string.

www.powerwerks.com. they have the OEM connectors at a good price. I
just converted all of my older rigs to the T- connectors and changed out
the connectors on my Gell Cells and in my cars.

The ID plate with serial number on it? That seems to only be held on with a dab of glue. Mine is loose on the edges too. Personally, rather than use glue, I think I'd use a RTV type of sealer instead. I plan on repainting my base, at which time I will re-attach my plate too.

I just got a bad surprise. The pre-addressed warranty registration card, that was packed with the new radio, was just returned to me by the Post Office stamped "Return to Sender, forward time has expired".

The radio is a new Vertex-150 2M handie purchased in March. Is this an inexplicable clerical oversight, a postal mistake, or is there a problem with Yaesu USA / Vertex Standard?

Don't know if you are actually looking for one or are just asking the question...

Icom made the 375A for a couple of years. They command a large sum because of their rarity- I've seen 'em offered from $1.1K to $1.8K IMHO, they are not worth it unless, of course, you just want one.

To me, a better way to go is a 222 mHz transverter connected either to an 80-10 HF rig or a 10 meter monobander. Have a look at www.downeastmicrowave.com. Assembled, they are $350, in a kit, about $100 less. Add to that the cost of the IF rig and it's a lot less than the 375A- and with equal or better performance.

Their address may have changed long since the cards were printed, and the post office only keeps forwarding for a year.

Lucky thing for you is, you do not need to send in that card to get warranty work done. Federal law precluded the need for warranty registrations at least three decades ago, but the companies still send out those cards. They use them a lot like spammers use e-mails, to get demographic information on customers. All you need for them to honor your warranty is your sales receipt. Barring that, most repair facilities will go by the serial number of the unit and warranty it accordingly.

Remove the paddle and squirt a small amount of super glue in between
the paddle and the arm. Use a small amount, it doesn't take much and
you don't want to make a mess. Re-install paddle. Done.

3866. Need Info. On Amp Supply LK-550 Jumpers

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-25 08:31:36 UTC
From: Bob <rmfuller@nospam.com>
Message-ID: <In6qa.752$fe.454@nwrddc04.gnilink.net>
Source record: 31098

I have an Amp Supply LK-550 HF amplifier. In the left rear corner near the A.C. cord entrance to the chassis, there is a small PC board with seven 4-pin Molex receptacles on it. Several plugs mate to these receptacles. I believe the configuration of these plugs sets the operating voltage for the amplifier.

My manual has left out the diagram which describes the proper plug positions. I'm hoping someone out there has a complete manual and can send me the diagram or if you have an amplifier and can look through the vent holes on the left side, you can see the jumpers.

These amps were only sold for 234V. operation, so I believe that there is only one setting that is proper. But, I think the board was generic to the Amp Supply line of amplifiers and many configurations are possible. Unfortunately, all but one of these is wrong.

Thanks in advance for any help.

In my email address, substitute "gte" for "nospam" or, my email on QRZ.com is good.

Thanks,

Bob, W7KWS

3867. Need PODS, Cables, and Software for Gould Biomation K105-D Logic Analyzer

We recently obtained a Gould Biomation K105-D Logic Analyzer.

The unit is missing the cables, pods, and probes. It is also missing the software that is loaded from the 5.25 disk drives.

We are looking for info on building our own cables and pods. We may be interested in purchasing these if the price is right.

We are also looking for a source for the operating system and applications used on this analyzer.

Any information will be appreciated...

Thanks and 73

I don't know anything specific about the K105, but I can tell you
that building LA probes that can be trusted is very difficult.
There's black magic in the inputs and in the cables. For example,
you make a round cable flexible by twisting it. If you're using
multiple
twisted pairs, it's common to run one pair down the center and twist
the others around it. The propagation delay down the center line
is significantly shorter than through the outside pairs. You have
to get cable specially made (read expensive) to equalize delays.
And you can't buy just ten feet of it.

If you're just doing timing analysis with the internal clock, it's
easier to convince yourself that the probe is working. Getting
the wrong state can be chalked up to missing the setup time requirement.
You just catch it on the next clock.

If you have slow risetimes and gobs of setup time and don't
need input protection or low capacitance and have
fixed ttl input levels and don't mind if you get the wrong state
sometimes, you can get by with TTL/CMOS buffers in the pod and a ribbon
cable with a shield plane.

There's a reason why logic analyzers without probes are cheap on ebay.
The only reason they're not free is that people think they can build
their
own probes.

Bottom line: If it's a hobby, go for it. If it's business, time
is money. You probably can't build probes for less than you can buy a
whole logic analyzer system. Use your internal resources to build
unique products that make money. Buy tools.

You need a logic analyzer to reduce your time spent.
If you can't trust it, it increases your time spent.
mike

This seems rather silly to me on their part. To put up a scanned copy of the manuals in PDF format, and the last firmware that they made available for the KAM/KAM PLUS would be a reasonable thing to do, even if they declare there is no support from them for any of the documentation or firmware.

As I return to packet radio and look at their new products, it leaves me with a rather bad taste in my mouth to know that they will not do anything whatsoever to help olde customers when they have all the software and manuals right there to assist people. I find it to be a very arogant point of view for them to take. Now maybe if they get enough requests they will change that, but at this point I emailed someone; somehow they came to the conclusion that they did not want to support KAM or KAM PLUS.

Michael Black <et472@FreeNet.Carleton.CA> wrote:
: You find a crystal manufacturer, and order from them. You
: give them the signal frequency you need, along with the
: receiver's manufacturer and model, and any other information
: you might have. Then they make the crystal for that receiver.

: Now, the crystal place may not have the information. In which
: case you look in the manual, where it's bound to provide information
: on changing the frequency, and include enough info so you can
: order a new crystal. If not, contact the manufacturer for
: this information.

The problem is complicated by the fact the manual is missing, the
manufacturer is out of business. All I have is my recall of a
conversation with someone about a decade ago. What I'm trying to do is
help someone retune this receiver.

I think it's right, this would be a third overtone crystal, not a second
overtone. The crystal is about 10x14x2 mm, with two leads about 5 or 6 mm
apart the leads look they're maybe 18-gauge wire.

Does anyone know the name of the package this crystal is in? If I were to
specify this package name and the frequency 41.2 Mhz would I be likely to
get something which is useable?

Thanks for the info! We found a slightly different problem with the KPC-3 last night. I had a good DB9M -> DB9F cable, but the DB9 <-> DB25 adapter wasn't passing the control lines properly. The end result was that I could hear it but not transmit. Now I have to build the radio cable for it and see if it can hear anything.

Still nothing out of the PK-12, though. I hand built a new cable for that one, and still nothing.

>To me, a better way to go is a 222 mHz transverter connected either to
>an 80-10 HF rig or a 10 meter monobander.

I've seen those, but they seem over-complicated. I prefer the Ten-Tec style transverter. You plug the antenna into one side and the radio into the other, hook it up to power and you're in business. You can even use 5 watts input. With those downeast ones, you have to have several different wires and cables going from the radio to the transverter and mere milliwatts for input power. Way too much trouble. I just wish Ten-Tech would come out with one.

I checked on that. I found JUST THE MODULE recently sold for $360! The radio itself seems to sell for $650 - $750. Combined, that's more than I paid for FT-100D. Way too much for a band I'd probably only use during contests.

Your warranty is good as long as you have your receipt. Returning
that warranty card does nothing to insure service on your radio, but a
copy of your purchase receipt does. I don't return the cards and see
no reason to since the proof of purchase is all that is required to
obtain warranty service.

3883. Re: KAM Enhancement Board / KAM EPROM Upgrade

Newsgroup: rec.radio.amateur.equipment

FYI, I made a decision with Pacterm for Windows to support the KAM-E and KAM PLUS with 7.0 firmware or later. Current release 1.7 does that.

In version 2.0 of Pacterm for Windows, due later this year, I still plan to support the KAM-E and KAM PLUS with 7.0 firmware or later.

I even decided to contine to support the KPC-1 with 5.0 firmware. That's almost a 20 year old TNC. :)

You need to read the section on the Downeast microwave site regarding
interfacing transverters. Read all of it. Downeast Microwave
transverters make a rig that absolutly blows away the Ten-Tec
transverters. Read the techinical figures and comepare.

I fully agree, Stuart. They have not responded to the message I left
on their tech support email address, so I guess the KAM+ is an orphan.
Mine has Version 6.1 firmware and no enhancement board. All I have
ever used it for was packet, aprs, & rtty. I have since moved to the
sound card audio & interface for rtty, mfsk, psk, so all that is left
on the KAM is packet/aprs. Actually, with AWGPE, those can be done
with the sound card interface, also - just haven't gotten around to
it.

The only digital modes I'm interested in that require a modem is
PACTOR II & III. That's so I can do Windowlink/airmail. I got my
KAM+ used, at a hamfest for 60 bucks. I'm glad I didn't pay more for
it -- and I'll not buy another.

Good luck.

We are looking for a remote microphone for HF rig use at a museum. It's purpose would be to allow the public to converse on the rig along with the supervising amateur. Anyone know of a company who sells one or how one could go about to do this? Thank you for yout time.

R4C Receiver Ser #28314-Includes two filters, CW 1.5 and CW .5

T4XC Transmitter Ser#27861

MN 2000 Tuner Ser #5019

MS 4 Power Supply Speaker Ser#59736

This station is in perfect working order and comes with manuals for all units and with all the necessary, labeled patch cords.

All units have perfect faces. No scratches, rub marks or scratched crystals.

The units have some very minor scratches on the top and sides, but nothing that would be objectionable to a reasonable buyer.

The MN2000 has some rub wear on the left side of the cabinet.

The MS 4 has had two holes drilled in the top in order to mount some kind of equipment. I'm not sure what the equipment was. Photos are available for serious buyers.

These units must be professionally packaged with form-fitting foam packing to assure safe arrival. Buyer to pay all packaging, shipping and insurance costs.

Asking $850.00.

Source record: 31126

I like them both so I had to do a lot of thinking before I laid out the $$$ also. One big consideration was the amount of useable memory. The 706 has 100 ch of memory and the 100d has 300+. Also with the new 857 Yeasu has dropped the price of the 100d and it is about $300.00 less then the 706. I also have antenna restrictions and the ATAS-120 fits the bill. Icom doesn't have an all in one antenna system for the 706 yet. One last thing is that the 706 receiver cuts off around 500 MHz and the 100d's cuts off at 999 MHz. Needless to say I picked up the 100d and am very happy with it.

That's incorrect. I spot checked 3 stores -- the 706 is running about
$50-60 less than the 100d.

Greetings!
I have been trying for several days to find anything in the way of schematics for the 5200 and 6000 series FRS hand held transceivers. My need is to design a simple intercom/ interface system for use with these radios while riding my motorcycle with my wife as a passenger. Searches have rendered many sites that sell millions of these units but no tech talk.
The units that are on the market from HJC Chatterbox as well as Nadi don't do everything I would like them to do and are pricey too.
At the very least A simple headset/mic wiring diagram would be useful and welcomed.
Discriminator line tap point and squelch amp line location is needed too, hence the need for complete schematic.
I have e-mailed Motorola but have not received any reply as yet.
Thankyou for your time and consideration.

I find it is a very versatile radio, but it does have a few bugs. One is that it does not seem to remember which sideband setting (USB or LSB) should be used for each band, although I have set it to do so. Another is the DSP performance. Although it is better than the external audio DSP units I have tried, it seems to me that it could be better. I know that seems qualitative rather than quantitative, but there is no way I can measure its real performance. And the sharp DSP setting is virtually useless on SSB because of the artifacts. It may be ok on CW, but I don't do CW.

There is one other thing I should mention. Although I am well equipped for test equipment, the radio requires a CD for alignment, which Kenwood will not release. So if you are into alignment, forget it.

By the way, does anyone know whether anybody has a copy of the CD? ;-)

Bob, W6NBI

The price I gave was Canadian. The Icom 706 was going for $1500.00 and the 100d new was $1300.00 give or take. I paid $1699.00 for the 100d and the remote kit including tax at http://ntfc.ca/index.htm back in January. I just checked them again and it looks like Icom finally dropped the price of the 706 to $1449.00 and Yeasu has the 100d at $1499.00. So this month Icom is cheaper.

Check out the Yahoo newsgroup TS-2000adjust. I may have the NG name not
right, but there are some of the folks who have come up with the adjust
software.

I'm using the TS2000 here and it works fine, but I too don't like the
idea of needing a CD to adjust the radio. This means if your smeter is
off you have to send it in. Or any other minor adjustment, bad idea.

Hello All,

I am looking for the cloning SW for the IC-T90 HT.
I recently purchased SW for a V8000 2M mobile
that I would be willing to trade for the CS-T90 SW.
Reply to serverman1@hotmail.com if interested.

Yes, you do. However, when compared with other 222mHz options, a
Downeast transverter is a good value with stellar performance,
especially if you already own a HF rig,

BTW: There was an article sometime in the last two years about
'assembling differently" a TenTec 2 meter transverter to work on
222mHz. The power was a little lower than at 144mHz but it seemed to
work.

Howdy,

Looking at the back of the AR 22 rotator control box (the old fashioned brown kind which has the dial on the front and is vertical) there are four screw heads which the four-wire cable is connected to.

I am assuming they are 1, 2, 3, 4 left to right. If this not true, let me know.

Thanks, Jack

Source record: 31068

Bill,

You might get a signle-edge razor to cut between the glass and the mount by holding it with visegrip pliers. Another way might work if you can get the right combination of f resistance (NiCr) wire and battery. Heat the wire with battery current and pull it through the adhesive foam pads. You will have to repalce them anyway when you remount it. There are remount kits but ordinary double-back tape will hold it. The spacing may not be close enough to get a good match but the stuff is cheap and you can always try again with the expensive stuff it doesn't work. Good luck!

GOOD GRIEF!!

Is the exchange rate THAT much different? JT Morgan from Tennessee (the guy
with the curious
hat) had them at Morganton, NC for $675 US. Would be better to visit US (or
would there would
be a tariff steep enough to make it not worthwhile.

Prices better than the bidding wars on eBay.

Kenwood TS-520S Station: $275
Includes: TS-520S Trasceiver
VFO-520 Remote VFO
One spare set of balanced finals.
Yeasu Dynamic Desk Mike
Add-on Digital Display (Not DG-5)
Has User and Service Manuals.
This transceiver works very well and still transmits a good 100 watts
into a dummy load as measured by a Bird 43 watt meter.

Icom IC-Z1A 2M/70CM HT with Maha 45 Watt Docking Station/Amplifier: $250
Includes: Two BP-173X, 9.6 volt/1000Mah Nickle-Metal Hydride batteries -
these are the ones that don't develop memories.
Has all User Manuals and wall charger for batteries.
HT transmits 5 watts with charged batteries on 2 meters and 3.5 watts
on 70CM.

All equipment is offered "As-is" to protect myself from golden screwdrivers.

I'm not much of a builder. About the only thing I've built are a couple of antennas. I wish TenTec would come out with one for 222mhz... or since Ranger is delving into the VHF bands with the RCI-5054, why not an RCI-2220 or something along those lines? :)

Get into the action on PSK31 for only a few bucks and one night's hookup.
This unit is in perfect condition and works with all 8 pin mike plug radios.
Manual and schematic included. Can be used with many shareware PSK programs.
Software not included.

Asking $30.00 shipped

> something along those lines? :)

Sure. Why not? Ranger will probably find out what all the other
manufacturers found out- the market is very small for 222 gear. And
it's the 'chicken or egg" thing. Guys aren't on 222 because there
isn't any gear and there isn't any gear because there are few guys on.
I got on 220 at the time of Novice Enhancement in 1987. In my area,
there was a lot of 220 activity for about 4 or 5 years. Then it all
dropped off. Most of the 220 repeaters disappeared and activity has
gone to a standstill.

So, maybe a manufacturers are going to make some 222 stuf. I wouldn't
count on it.

3950. Kenwood TM-742 Weird Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-28 04:16:02 UTC
From: fmmck@aol.com
Message-ID: <20030428001602.19783.00000237@mb-m20.aol.com>
Source record: 31082

I'm having the same intermittent problem with a TM-742 and a TM-942. When they stop working, it is hard to tell. The display shows output when the microphone is keyed, but there is none according to a wattmeter. A nearby receiver can't pick up anything on the transmit frequency.

The receiver can't hear anything either. I noticed that the normal beeps are not present, but return when the radio starts working again.

I tried a variable-voltage power supply, thinking the wiring in my car might be bad. Whether they worked or not seemed to have no relation to voltage.

The TM-742 is older and still retains its memory when disconnected from power. The TM-942 has already had the Lithium battery changed. The one thing the two radios have in common, is that before I noticed the problem, I had swapped modules around in order to access their frequency adjustments, and returned them to their original configuration before re-assembling.

Has anyone solved a similar problem with the TM-642/742/942? Since both radios have the same problem, it would appear to have been caused by something I did, but I can't figure out what it was!

Thanks for any help.

3953. FS: Nye Viking Antenna Tuner

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-28 05:12:13 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <NK2ra.43424$ey1.4044418@newsread1.prod.itd.earthlink.net>
Source record: 31085
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

The MB-V-A Nye Viking tuner will handle power in excess of 3000 watts PEP sideband and CW with a continuous rating of 1500 watts into loads between 40 and 2000 ohms impedance with an SWR reading below 1.1:1.
A 3KW trifilar wound broadband balun provides balanced output to twin lead feeders 100 to 1000 ohms resistance and unbalanced output impedance down to 20 ohms at the Coax "A" and "B" outputs.
The unit features 2 1/4" tuning knobs with 4" dials; a 1 to 25 vernier readout over 360 degrees on the variable inductor tuning plus 360 degree readout on the variable capacitor. The extra heavy gauge aluminum cabinet provides adequate shielding.
The input connector from the transmitter or linear amplifier is a standard SO-239 UHF connector and the output terminals are high voltage porcelain feed-thrus and SO239 Delrin UHF coax connectors for 50 or 72 ohm coaxial cables.

Frequency range is 3.5 to 30 MHz with limited coverage of the 1.8-2.0 band segment
The size is 14 1/2" wide, 6 3/4 high and 12 1/4" deep.
Shipping weight is 20 pounds.

This unit has a few scratches on the top of the cabinet, so I cannot call it excellent, but scratches don't hurt the performance of this very high quality, high power tuner.

I am asking $650.00 plus packaging/shipping.

I'm not so sure the interest in 220 would be for FM (although there seems to be plenty of (expensive) FM rigs for the band. At least in my area, there are so many 2m repeaters within range of an HT, that repeaters on other bands are pretty much useless. Why would I want to talk on a 6m, 1.25m or 70cm repeater? The 2m repeaters aren't over crowded around here, just plentiful. As a matter of fact, I went and bought the Yaesu FT-8900 quadband radio with a quadband antenna and ended up selling it after a couple of months because I just wasn't using anything other than 2m. I now have an FT-1500 (2m monoband) in the car.

I am sure many VHF contesters would love a 220 SSB rig for use in the contests. I'm not a huge contester, but I do like to fire up the 6m and the dualband yagis in Jan, June and Sept for the contests. With the cost so high to get onto 220 mhz, an alternative similar to the RCI-5054 would be nice, or maybe even an MFJ "Adventure radio", like the current SSB radios they sell.

This Kenwood TM-241A 2 Meter Transceiver belonged to a friend of mine who bought it several years ago and never took it out of the box. The original sales receipt is included. I took it out of the box and checked it out. It works perfectly and is a 10 of 10. It includes the original box, mic, power cable, manual, mobile mounting bracket, and standard accessories package(fuses, bolts, screws, and mic clip). This is a 50 watts 2 meter mobile transceiver. Price is $125. Thanks, Charlie Hugg, K5MBX

I have a like new RF Applications P-2000A SWR/Power Meter for sale. This is just like the P-3000A except it has the analog meters rather than the digital meters. This is the one that has the SWR Alarm/Relay that cuts off your amplifier if there is high SWR. It has 200 watt and 2000 watt calibrations on the meter and switches automatically from one power lever to the other depending on the power you are running. This a quality meter with lots of extras. It come with the meter, coupler, all connecting cables, and manual. It requires a 12 Volt DC power source, not included. Price is $255. Thanks, Charlie Hugg, K5MBX

3961. *******BEWARE OF SALES OR TRADING WITH "Mitch Roberston"

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-28 19:36:46 UTC
From: TIA <no1@nowhere.com>
Message-ID: <var0qfo1q9qi58@corp.supernews.com>
Source record: 31093
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.cb,rec.radio.scanner

Ya know I always know better but for some reason this time I didn't heed my own warning. I had advertised a HR2600 with a chipswitch and 2 - 150 amps for sale. One having a preamp switch problem and needed a new switch but the amp side worked perfectly. And I got alot of action but no sales. Well after 2-3 months I got an email from

MITCH N2RADIO [mitch@n2radio.com] MITCHELL Robertson [MR_CPTN@militaryministry.net]

Stating that he had a 6900TB to and an Boomer 600 amp to trade for my stuff. I was like ok, no problem. I got everything packaged up in bubble wrap and boxed real well. And waited for ups to pick it up. And he was to do the same. Well he gave me a tracking number 2 days later and the package was on its way to me. Well mine left and went to him. I triple checked the operation of all the equipment before I packaged it up. Just because I did a trade earlier that month (Sept) and had a DOA problem with a scanner. So I made sure that the equip worked perfectly. Well I found out that Mitch was in the military and was being shipped out. And his family is moving. So they wouldn't be able to get email for some time.

Well the package arrived at completely the wrong address, which was intentional because Mitch and his wife Laura had both double-checked the shipping addy with me. I finally get the package and guess what? Its 3 Chilton's repair manuals no equipment to be found. Well did I get hosed but bad. So over the next 4 months I emailed both addresses well over a hundred times. And no response at all. Well I have a few connections in the military and I'm making some requests. I'll see what happens it should be interesting to say the least. The last email I sent Mitch and his wife I told him this and told him by Jan 1 If I didn't hear anything I would take action. Still no reply!!

Well as I'm typing guess what, I get a box in ups!! SO I open it up and there is my 2600 back and one 150 amp that I sent to him. And a note that the 2600 doesn't receive, the first amp is dead, and he kept the other amp and sent me 2 beat up 15.00 microphones one with an echo. DAM JUNK!! And a mini para dynamics meter DOUBLE JUNK!!! Then he has the balls to throw in a pc board for an amp kit. Well I just wanted EVERYONE to know what happened to me. So if you do business with him BEWARE I warned you.

Bob,
The jumper boards in the Amp Supply's are really confusing. I have some
LK-800's with and without ext. xfmrs, and an LK-550 that I can't find at the
moment. It's been my experience that the manuals don't always help either
since the diagrams were often "generic".
If you can't come up with the info, let me know and I'll dig out the RF
deck for the 550.

<< Common problem, resolder R121 on control unit A/2 >>

Clif-

Thanks for the suggestion. In the diagram I found an R121 feeding the base of a transistor on another board, that appears to be a likely candidate. I think it is the board that the band modules plug into.

Unfortunately I'm having a problem disassembling my TM-942. It seems that when the battery was replaced, some screw heads were stripped, one screw to the power bus had stripped threads, and one or two screws holding the band modules are missing. I can understand how it happened, having had similar difficulties on the other unit. I just wish they had replaced the damaged screws! So far I haven't been able to remove two of the small screws that hold the band modules and one screw to the power bus. A fresh, sharp set of phillips screwdrivers may do the job, but I suspect surgery will be required!

Description: 1 kW solid state amp with integrated fully automatic antenna tuner. 160-12 meter bands, easy mod for 10 meter band. FULLY controlled by Icom transceivers for seamless operation. Remote control head compliments and places next to transceiver while main unit is out of the way on casters (wheels). This amp was made from approximately 1990 to 1996-97.

Control head is in perfect condition, no scratches. Amp and power supply (which sit on the floor or under the desk) has some scuff marks.

Perfect working order. Control head weighs 6 lbs., Linear weighs 80 pounds. Crating weight will determine the actual shipping weight. This amp will be professionally boxed (3 boxes) in custom form-fitting foam.

Asking $3500.00 plus shipping/insurance.

Hello All,
I am in the process of repairing an old ICOM IC720A HF transceiver.
Its been got at (badly) by previous repair "attempt" - can anyone
assist with a schematic of the logic board (lives behind the front
panel, has CPU, display driver etc on it. Must be the 720A, not the
720.
Regards,
Andrew VK3BFA

well i dont know how well your made of money and how important the
memory channels are but the FT100D is 769$ versus the 706s 719$ at
texastowers.com which isnt a huge differnce but the 706 comes with the
seperator kit i dont know if the yaesu does or not
i am very happy with the 706 and dont use the memory channels it has so
thats not a problem for me and since you cant program the memory
channels anyways any more than 99 would be a BIG hassle
good luck

> Both have DSP, good receivers and about equal power.
>

First, let me say I do not have an IC-706(any flavor); I do own and use as a mobile the FT-100D.

From reading the FT-100 User's Group on Yahoo!, your statement above is almost correct. Both radios have DSP and both have 100W on HF. However, according to the folks on the Yahoo! group who have used/owned both radios, the receiver in the FT-100D is a great deal more sensitive than the receiver in the IC-706.

However, there is another overriding reason to get the FT-100D. If you are going to use the radio as a mobile, I can confirm that the Noise Blanker in the FT-100D is outstanding!! Again, according to the folks on the Yahoo! FT-100 group, there might as well not be a noise blanker in the IC-706 because the thing is totally ineffective!

You might want to post your question on the FT-100 User's Group on Yahoo. Someone there who has experience with both radios can give you a blow-by-blow comparison.

Hope this helps,

Turner

Ebay won't help - I keep getting canned messages back that they don't release personal info on people? Maybe someone here can help?

I'm having a problem getting my money back from this guy and now he won't respond to emails or my requests for a refund although he says he has a 30 day money back guarantee on his products.

I'm afraid to leave negative feedback which wouldn't help get my money anyway as he has already said he'll do likewise.

I want to alert his local authorities and see if that does any good! Anyone know who this guy is?

Bob J.

I just checked this guys profile, coal-76 has 402 positives on eBay
with no negatives. If he is such a crook, how does he get so many
positive feedback reports. Surely people post feedback after having
received the product.

Good reason to use a postal money order instead of paypal. With the
USPS you can get him for mail fraud, and those folks don't kid around.
They'll get the real ID info from ebay.

3992. $24.97 for a 2M HT at RS

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-29 16:29:43 UTC
From: bball@green.home.org
Message-ID: <slrnbatb3f.rq9.bball@green.home.org>
Source record: 31024

- fyi: i know they've been on sale before, but if you can find one of the tinker-toy HTX-200s at a local RS, they're now $24.97!

- perhaps someone could clarify: the units are AA-driven and only put out at 200mW on batteries... supposedly more power at 9V DC...

here are the questions:

1. previous manuals stated 9V DC, 800mA, center positive
current manual states 9V DC, 800mA

which is correct?

2. current manual states 2W on 9V DC, but i seem to recall seeing only 1W output

which is correct?

- if no idea, i'll get an SWR meter and check...

- btw, i also found an HTX-245 for $49.95 - w/dead audio, so it has been sent to RS for repair (most likely some previous purchaser hooked up a speaker/mic combo w/common ground and blew out a circuit)

3994. Plantronics DX10 vintage HF radio

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-29 17:01:12 UTC
From: SCR300 <scr300@comcast.net>
Message-ID: <8v-dnb1WCL1AMjOjXTWcqw@comcast.com>
Source record: 31026
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Does anyone know where I could get the manual for a Plantronics DX10
avionics HF radio?
It is a vintage radio from the late sixties, AM only though 12 crystal
controlled channels.
It appears to me that it actually originates from SunAir, given the applied
construction techniques and the fact that the ID plate mentions Ft
Lauderdale, FL

If you have more information, let me know, thanks!

How about filing a small claims court claim against e-bay as a
"co-conspirator" aiding and abetting the thief through its silence?

3996. Re: Who is ebay Coal-76?

I wonder how quick E-Bay would divulge info if sued in small claims court for aiding and abetting thievery by claiming "confidentiality" of thieve's records?

I would be surprised it you even find one; I bought the last two them in the Chicago area back in December of last year. I have one of them, and I sent the other one out to Brenda Ann. I am not sure about the power output.....I just got mine for hamfest use. I hope you find one.....it isn't a bad unit, and yes, it does run on AA batteries.

They seem to be sold out in the stores I've checked in the SF Bay
area. I got one last month for $50 - it was the store demo unit,
apparently.

> - perhaps someone could clarify: the units are AA-driven and only
> put out at 200mW on batteries... supposedly more power at 9V DC...
>
> here are the questions:
>
> 1. previous manuals stated 9V DC, 800mA, center positive
> current manual states 9V DC, 800mA
>
> which is correct?

The only difference between these two descriptions you've given, is
the additional detail that the center pin is positive polarity.

I can confirm that center-positive is correct. I built a small
portable LM317-based regulator (PowerPoles on one side, power miniplug
on the other), center positive, and it works quite nicely with this
radio. Potted the whole thing in sand/epoxy using a 35mm film can as
a mold... should be pretty much bulletproof.

>> 2. current manual states 2W on 9V DC, but i seem to recall
>> seeing only 1W output
>>
>> which is correct?

Haven't measured it myself. I suspect that the power output is
voltage-limited - tripling the supply voltage (3 VDC internal to 9 VDC
external) would roughly triple the voltage available to the RF power
transistor(s) and would give roughly 9x the power. Since the HT is
rated at 200 mW on batteries, I can believe 2 watts (plus or minus a
hair) on external power.

Considering its rather obvious limitations (low power and dinky
antenna) it isn't such a bad little radio for close-in work. I took
mine as a backup when I rode bicycle-mobile this weekend for the local
March of Dimes Walkathon. It didn't have anywhere near the power and
reach of my main bike setup (VX-5 with a J-pole built into the bicycle

safety flag) but over most of the course I could hear and be heard
just fine. In difficult spots (where the course followed a streambed
valley, with very limited line-of-sight) it couldn't cut it.

Usage hint: its setting for tone squelch is either ON or OFF.
There's no separate setting for "send tone, but use carrier squelch on
receive" as their is on most radios. However, the transmit and
receive tones are individually controllable, and the receive tone has
an undocumented "OFF" setting... in this position, the radio uses
carrier squelch on receive even if the main tone-squelch setting is
"ON".

As if they had never considered nor encountered this in several
billion trades. Look at the number of CEO's taking a bonus for
delivering capital assets to morgue and try to call a cop. You might
get off easy with 20 years in Sing-sing.

Wait a year, bring it up again, and the GOP could use this outrage to
lever us into taking out France for harboring known Bids of Massive
Consumption.

It sure takes a lot of excuses to not do the right thing first: drop a
dime.

- thanks for the info! i was able to get one at an RS around the corner

- i think i'll program it for a local repeater and then put it
'dumb' mode (lock) to avoid making any settings changes

- not a bad deal, really - but i can't see spending extra $$ on
any accessories such as a DC adapter, etc... although i did
get one of the $1.97 FRS cases most RS shops have on the
shelves...

- this is one unit i won't worry about dropping, etc...
(unlike my VX-5r or IC-t90a)

:-)

Turner,

I am also wrestling with this choice and as a user of the FT-100D maybe
you could answer one question for me. I note that the supplied
microphone appears to have a keypad - is it possible to use this keypad
to directly enter a frequency, or to go directly to a channel?

I find a keypad very useful when wanting to QSY to a specific frequency
rather than using the VFO.

Thanks,
Dave

4008. Looking for possible suggestions on dual recieve dual band HT...

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-30 04:08:09 UTC
From: Evan Platt <evan@TheObvious.espphotography.com>
Message-ID: <0liuavc6g36b0lgmfu6d13tf7atuos380f@4ax.com>
Source record: 31040

I'm looking for a dual band HT. 2m/440, 800 rx (856.xxx, 867.xxxx),
and T-Band tx (488.xxx). low band VHF (42 - 43) would be nice, but
not necessary. Size doesn't matter - as a matter of fact, I'd prefer a
larger radio than those new HT's that are the size of a pack of cards.

Any radios that will do the above?? I've seen a number of radios but
the official specs show 420 -470, even though the radio may recieve
488.

Thanks. :)

Evan

4010. Sneaky eBay posts

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-30 07:02:13 UTC
From: Pete KE9OA <n.gianakopoulos@worldnet.att.net>
Message-ID: <VxKra.131578$ja4.5814329@bgtnsc05-news.ops.worldnet.att.net>

I've found a good cure for the folks who deceptively hawk their eBay ads by not mentioning it in their title. With Outlook Express, it is pretty easy. On the menubar go to Message/Block Sender, and all of the posts from that person will be deleted from your view. If somebody has FA or For Auction in their title, that's one thing, but when they get sneaky.....unfortunately, they are the losers, because if they ever have need of advice, etc, their messages will not show up. I used this technique to get rid of that message that has been showing up at the top of the list for the past few days. You do have to do this with every newsgroup that you view, though. It is amazing.....if I look at these newsgroups from somebody elses computer, the proliferation of those ads are higher than one would think. You can also do the same thing with those folks pretending that they need Motorola software, or Codeplug data. You have to be quite careful here.....many of these posts MAY not be on the up-and-up. This could be an entrapment attempt. I also block those senders. There was one fellow that was playing this "pretend" game, and when I questioned him, he never got back to me. He is also in the Chicago area.

Pete

4011. Beginner wants to build VHF radio - book recommendations?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-04-30 10:46:25 UTC
From: Dwight Stewart <stewart@say.net>
Message-ID: <BAD521C0.17F9A%stewart@say.net>
Source record: 31043
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,alt.ham-radio.vhf-uhf

I'd like to build a VHF (6m or 2m) SSB radio. I'm most interested on VHF at the moment because of my license class, but will probably also want to build an HF radio sometime down the road.

And, while I can actually tell the difference between a resister and a battery, I am clearly not an expert at electronics. So this project will also serve as a learning experience for me.

Given the above, can you recommend a good book, again oriented towards the beginner, on home brewing a VHF SSB radio?

Your suggestions are truly appreciated.

Dwight Stewart (W5NET)

Hate to" bust your bubble" but it`s not possible for many,many reasons. For a good start,You might look into some kit projects like Ramsey and others.. 73 W4PQW

If you are really as raw a beginner as you claim - perhaps you should
consider a kit?
The good ol' guys from MFJ come to mind. No gee wizz performance but not a
heap of junk either - Also very reasonably priced.

Hi,
Try looking at the Ten-Tec line of products they have radios,transverters
(converts 2M to 6M any mode).
Most of what Ten-Tec sells is kits .

Hi Dwight,
Unless you already have a LARGE amount of RF design knowledge, homebrewing an SSB rig (and VHF at that) is not feasable. Look at Hand Products- they make a 6M SSB kit- even these will require good soldering skills and good tools.

The closest I can think of is Ten Tec, which has transceiver kits for
6 and 2 meter FM (no ssb, alas), as well as cw qrp kits for the hf
bands.

For a vhf ssb radio to build, you might look at some of the older ARRL
handbooks, but I'm not sure you'll find anything there, either. Or do
a search at the ARRL web site for a QST article on such a critter.

That certainly clarifies it. Quoting from the FAQ:

'The .equipment group is NOT the place for buying or selling
equipment; that's what rec.radio.swap is for.'

I've never been fond of the FS and FA postings, but didn't know they
were actually contra-FAQ. That's good ;-)

But if it really worked, there would be no fraud on ebay.

How do you figure that?

You may dislike eBay, but it gives a lot of folks a chance to own
items they ordinarily wouldn't find in a lifetime. A lot of items
that may appear to be rare are often regularly found on eBay.
A lot of folks don't like eBay because things that used to be "cheap"
are now fair market priced according to supply and demand.

I've had over 150 transactions on eBay. I've had problems with
buyers and sellers, but I haven't lost a dime yet. For the few times
I've had problems with bad contact info, the sellers have been removed
from the site.

I've been burned a few times on ebay.. but mostly for cheap stuff... been
burned in this NG for a lot more money than I care to talk about.. and it
seems that just because someone's a fellow ham doesn't necessarily mean they
can be trusted. All in all, ebay at least has buyer and seller protections
available. If a person decides not to take advantage of them, then it is
pretty much down to a bad choice if they get burned.

If everyone who ripped anyone off on Ebay were reported and actred upon,
they would go away. Then anyone who was thinking about going there to
rip people off would certainly think twice about it.

>
> You may dislike eBay, but it gives a lot of folks a chance to own

hmm, that could be extrapolated to a lot of things.

> A lot of items
> that may appear to be rare are often regularly found on eBay.
> A lot of folks don't like eBay because things that used to be "cheap"

Possibly. Something has to explain why some used, still available equipment goes for more than new. Someone actually bought a used FT-50 for 40 dollars more than I paid for mine brand new. All that, and no warrantee!

People can buy and sell for whatever they want of course. But fair market price? Not even.

The only thing I would have to say about the whole auction thing is that consumerism has turned most people into very non-savvy buyers. After enough people get ripped on ebay (and yes, used equipment going for more than new is a person getting ripped) they will become educated, and the seller market there will go away. So maybe there is a purpose for the auctions, if only to serve as an example to others.

I don't see how it could be a "great" deal more sensitive. The 706mk2g
I have is plenty sensitive. What bands are they refering to? I haven't
done any real comparison tests on vhf/uhf, but on HF, I know the 706
is as sensistive as it would ever need to be. It's as sensistive as
any of my other rigs. Probably more so, and the specs say it should be
at about .11mv to .15mv for 10 db s/n depending on the band . Those
are dang good specs. If they don't pan out, must be an alignment
problem, or the sensitivity is turned down in the radio. I've never
noticed any problems on VHF/UHF hearing anything compared to say my
yaesu ft-2500m, which is quite good for FM. I would think if there is
a difference between the two, it would show up more the higher in freq
you go. Also, the sensitivity is internally adjustable on the 706's.
Maybe it was set too low, if they had trouble receiving. As one
comparison, I use mine for air band receiving quite a bit. And this is
a band where the specs for the ham bands don't apply. The air band
sensitivity on the 706g blows away any scanner I've ever tried. And my
antenna is not even tuned for that band. But I've never been able to
compare it to a ft-100 in that case.

>
> However, there is another overriding reason to get the FT-100D. If you are

> FT-100 group, there might as well not be a noise blanker in the IC-706
> because the thing is totally ineffective!

Again, that is not the case here. Mine works about as well as any
other radio I have. But they have to be aware that some types of
noises are hard to blank with any blanker. I'd say the adjustable
blanker on my TS-830 is about as good as any I have. It works quite

well. Anyway, the 706g's is just about as good, but not adjustable as far as a front panel control. I've seen many types of noise it totally took out. Completely. And I have seen some types that it wouldn't do much with. But, in those cases that the 706 couldn't cut it out, the TS-830 usually wouldn't either. Those cases are where the noise pulses are so rapid and close together that there are no real gaps to leave in. If you have no "clean" gaps, no NB will do a decent job. I think these "reviews" of the NB's are just flukes of the draw really, unless they actually did side by side comparions with an A/B switch. The NB in the 706 works no better and no worse than any others I've seen.

Overall, I think both are good radios. I think one should pick on the overall balance of features, looks, whatever that they like. I went with the 706 because of the SO-239's instead of pigtails, and the 100% duty cycle transmitter compared to the 50% duty cycle of the ft-100. Also the ft-100 wants a 22 amp supply for 100w, and the 706 uses the usual 20 amp supply for 100w. I thought that was a bit odd. That seems to tell me the ft-100 makes a bit more heat per amp drawn than the 706. The 706 seems a tad more "solid" feeling than the ft-100 to me. But I do miss the 300 memories and higher UHF receive that the ft-100 can do. You can't get military aircraft on a 706. You can on a ft-100. You can also listen to 220 mhz on a ft-100. Not on a 706... I filled up all the 706's memories the first day I got it. Could use 200 more... But other than that, I've been really happy with the 706mk2g. I've run it nearly 24 hours a day non stop for two years, and it hasn't skipped a beat. The receive audio is good, and same with the transmit. No lack of sensitivity here at all. Might be an alignment problem/quirk with those other guys...? Of the ones that have had both, the results seem mixed. Some prefer the 706, some the ft-100. I think probably a preference thing more than anything. I woudn't mind having one of each. :) MK

I don't know about that. Even I can build one of those. Seriously, if you want to see what it takes to design a receiver, check out my website at: http://home.att.net/~n.gianakopoulos/wsb/html/view.cgi-home.html-.html This receiver could be used up on the 6 and 2M bands, but it would be good to add an RF stage ahead of the mixer. Also, you would need to change the LO injection frequencies, and the input filter parameters.

Thanks for the suggestion, both Mark and Roger. However, I've already built many kits. And while I did learn a little from those kits, it was certainly not enough to build my own VHF radio without serious guidance. There are still simply too many gaps in my knowledge about electronics. In other words, I'm still a beginner in too many areas. Because of that, the books I've seen on radio construction lose me fairly quickly. Therefore, I was hoping for a book that didn't assume so much knowledge on the part of the reader. With that, I could probably muddle my way through to a fairly basic radio.

You took the trouble to get your license. Do you not have a copy of
the ARRL Radio Amateur's Handbook? It assumes no knowledge on your
part, takes you through basic electronics, and explains how
transmitters and receivers work. Yes, it gets techy and complicated,
but transceivers are complicated, especially if you try to understand
what makes them work. I'd say, read the handbook, cover to cover, and
look at the ARRL website for more specialized books on transceiver
design. If those books "lose you" fairly quickly, then join the
majority of hams whose knowledge about electronics is a mile wide and
an inch deep :-)

I'd have to agree with you about the kits. I've built plenty of those,
and hooking them up is kind of like painted by the numbers. Neither
exercise is likely to turn you into a radio expert or an artist.

Bob

I don't think a vhf ssb rig is "basic". A cat's whisker radio, yes,
but not a ssb rig for 6 or 2.

OK, the problem is that you have to learn to walk before you can learn to
run.

If you've built kits, then the next step is building from a schematic and
parts list. I'd suggest "W1FB's Design Notebook" by Doug DeMaw W1FB/SK, as
a good starting place. He gives several simple designs, in schematic form,
and has some good suggestions on construction practices. Also be reading
"Solid State Design for the Radio Amateur" by Doug DeMaw and Wes Hayward
(nominally out-of-print but still easily available from lots of places).

Plan on doing your earlier experimentation at HF rather than VHF. You can
get away with murder at HF and things will still work. VHF is not so
forgiving. There is a LOT of stuff to be learned before you can design your
own VHF rig.

(snip)
Why a SSB radio? While there is some activity on VHF SSB, it is tiny
compared to HF SSB. Aside from VHF/UHF contests a few times a year, most
VHF/UHF SSB is *very* local. If there is any activity at all in your area
it may only be one or two nights a week. Some places have virtually none.

Maybe an FM radio would be better?

First off if you need a Noise blanker to run mobile you have a not installed your system correctly. Thats a fact.

Second look up both rigs in the QST lab tests you will find your final answers there. The 706 G is the winner all round. Buy it put the ssb or cw filter in it and your done. You wont have problems that creep up on you like the ft100/d models. Its not in its class. I dont own either now and have had both. I sold the Ft100 in 2 weeks after hearing and playing with a MKG model. And the audio is much better. But find out for youself. I wish you people would do your homework. Look at reviews. They will tell you all. Going to the FT100 Yahoo site is crap. They all own the FT100ssss! Go to eham.net or other like that. Make notes before you make your purchase. Why do you think yeasu came out with a new mobile? To try to compete with the 706 that they were lossing there asses too. That new one doesnt even come with DSP!!! The gall! They make you pay 60 bucks for that option. Wake up big 3 DSP is a standard now.

- i don't doubt it... i found an htx-245 locally in N. Va., but audio was dead - i could have returned it, but i just want to see if RS service is any good, so i sent it in for warranty work - if it comes back and works OK, i will have gotten an htx-245 for $45!

- the hxt-200 is good for monitoring, although i can easily hit my local repeater using a little pocket J-pole i built (about $3 in parts)...

I concur with John completely. I'm currently at the stage where I'm designing
and building HF stuff and scratching my head when it doesn't do what *I* think
it should be doing. It's humbling, to say the least. The Radio Amateur's
Handbook and Solid State Design for the Radio Amateur are two must-have books.

My suggestion is to get a copy of LTSpice from Linear Technology - http://www.linear-tech.com/software/. The price is right. ;-) I like to design
a stage, simulate it, and then mock it up and see how far off I am. Then I try my hand at tweaking to get closer to the simulation. I'm looking forward
to designing VHF, UHF, and microwave hardware, but I'm definitely not there, yet.

- Bruce

Hi there,

Im thinking of buying an FT101ZD, Mk1 . How low should I be able to set the drive on one of these? I rarely use more than 10W RFout and enjoy QRP ssb and cw. I Know the FT101ZD is not an obvious choice for a QRP rig. How low can they go?

Cheers, John.

I can't find this anywhere: what CI-V address does the IC-T90A use? (I'm assuming it does use that protocol, as most other ICOM gear). Also, is there some key combination which must be pressed before it goes into the CI-V "transceive" mode?

Thanks a lot in advance.

That's the feeding frenzy syndrome. A person gets caught up in the auction and doesn't check what a new one would be before bidding.

>
> People can buy and sell for whatever they want of course. But fair
> market price? Not even.

Sometimes yes and sometimes no. Some buyers expect to get something for a dime on the dollar and that's usually an unrealistic expectation especially if more that one person wants it.

>
> The only thing I would have to say about the whole auction thing is
> that consumerism has turned most people into very non-savvy buyers.

Any one who pays more used than new has only himself or herself to blame. They should have checked the new price before going into the bidding process. It is NOT the seller's fault if someone is so stupid as to bid that high. It is NOT the seller then who is ripping a person off. It's the bidder's own fault in that situation.

4056. FS: Collins 30S-1 HF Amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-02 01:41:31 UTC
From: Rich W6VX <wu6t@earthlink.net>
Message-ID: <f1ksa.50855$4P1.4744562@newsread2.prod.itd.earthlink.net>
Source record: 30938
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

The 30S-1 R-F Linear Amplifier consists of a one-stage linear amplifier and the necessary power supplies. It is capable of maximum legal input power in the amateur bands between 3.5 and 29.7 MHz. It operates in either CW or SSB service with any exciter (such as KWM-1, KWM-2 or 32-S1, etc.) capable of 80 watts PEP output. IN addition, the amplifier may be operated outside the amateur bands at any frequency between 3.4 and 30 MHz by retuning its input circuits.

Serial number 11590.

This amplifier is of museum quality. There are no scratches on the unit anywhere. The face is perfect except for some rub wear on the on/off buttons. The unit is in perfect working order and uses the 3CX1000A tube. This amp will come with the original Collins manual. The pages are still crisp and the book has no pencil marks other than the serial number on the front cover. The manual is dated March 15, 1965.

Amp will be crated for shipping. Shipping/insurance/crating will be paid by the customer.

Amplifier weight is 160 pounds. 30 5/8 in. high, 17 in. wide, 18-3/4 deep (overall dimensions) Crating for shipment will add 10 to 25 pounds to its shipping weight.

Local pickup in Southern California (Los Angeles area) is preferred.

Asking $3250.00 plus shipping.

If you aren't getting a response from this guy, then it
seems fairly obvious that you probably won't be getting
any money back from him. It's also fairly obvious that if
you don't follow the standard procedure for a complaint,
then you are only 'helping' the problem, not solving it.
So, why 'do it' the right way? Write it off as a learning
experience, do the complaint thing the correct way, and
quit whining, it doesn't do anyone any good.

Smart eBay bidding rules:
1. Ask your self if it's really worth that much to
someone other than your self.
2. Always pay by postal money order or by credit card.
With those, you have recourse if there is fraud.
3. The 'seller' wants your money. Make him/her provide
adequate information as to who/what/where and what
shape the item is in.
4. If you have ~any~ doubts, don't bid.
5. If there is a problem. Complain to the seller, 'eBay',
and the Post Office/Credit company, in that order.
6. Stopping payment is ALWAYS an option when fraud is
involved. If you stop payment without adequate reason,
you are the one committing fraud (make sure you are right).

And the smartest thing anyone can tell you is to NEVER buy
something from 'eBay', only sell there.
'Doc

Absolutely! Being stupid is not against the law. Any price arrived at
between buyer and seller is strictly their own business. But that said,
please forgive me if I am a little more sympathetic to the buyer in this
sad little scenario. I've listened to enough sellers with a carny's
attitude toward those "rubes" who buy off them to be annoyed with the
whole process.

It's probably not fashionable any more, But I was taught to not take advantadge of people less fortunate than or smart as myself. Everyone elses MMV..

Ok the latest tangent for a future display are:

Home Broadcasters, Phone Oscillators and Babysitters!

looking for the actual items of course, but to go along with that, advertisements, and some first hand oral history about your early experiences and fun and trouble you got into etc etc regarding these devices!

It would be interesting to now how many folks that enjoyed these went into some form of broadcasting.....

Three that I remember myself were the

knight kit little blue unit with the 50c5's in it (had loads of fun with one of these! This baby would be fun to play with again!)

the RCA Unit (I almost remember this having a pentode or a pentagrid tube in it.....

Lafayette unit... Did not have one but always looked in the catalog at it.

Was there also a heathkit unit? I seem to think so but a catalog check will fill in the details of it's existence.

a close brother to the home broadcaster was the 'baby sitter' and knew people when I was young that kludged extra inputs and preamps onto these.....

Yep want examples of all of them! cash, trade, free... whatever!

But most of all want some history of peoples involvement with them to add to the section on the web site.

please contact me off list.

Which ones would that be? Does their cheir charta explicitly identifiy
top-posting as a requirement for participation?

I believe you are on rather shaky ground with that assertion.

What he meant to say was, there are *hords* of uninformed users
on Usnet who don't know any better, and they are even the
majority (if not nearly the total) of users in some newsgroups.

See what happens when you let just _anybody_ have access!

(Where "Anybody" is defined as whatever recognizable group showed
up immediately following the group you were part of... ;-)

I remember people saying that The Well was the death of Usenet,
and then it was people from The Well saying "It's September,
again" or "What do you expect from an .edu domain." Then it was
the institutional folks who didn't like the unwashed masses that
PSI and UUnet allowed.

Of course when AOL hit (never mind WebTV), lets face it, this
wasn't a very funny joke anymore... But we have to admit the
Internet (never mind Usenet) wouldn't be what it is if every
other grandmother in the country wasn't connected.

But damned, the least they could do is learn a little style.

These commercial receivers, and others of their ilk, such as the Racal, Rockwell, WJ, etc. are in another class. Generally higher IP3 ratings, but more importantly is the ruggedness factor. You will generally see modularized construction, or egg crate construction where the different stages are enclosed inside of compartments in a die-cast aluminum chassis. Spurious emissions will usually be lower, since much of this equipment is used for surveilance, and a low amount of detectability is desired. Will these receivers hear anything that the Icom 756PRO will? Probably not. Will the 756PRO hear anything that the R75, the FGR100, the AOR7030, the Palstar R30 will? Probably not. It doesn't take more than 150 dollars to build a receiver that will perform with the best of them. Most of the price is reflected by the non-recurrent engineering costs, especially with a new consumer product.
Oh, I think that you would like the Harris unit. One characteristic of all of the 5K+ receivers is the high amount of gain in the I.F. strip. I've played with the Harris units, the WJ units, and I've owned the Collins 674U, the PRC515, the HF8050, the HF2050, and the Racal 6790/GM. They all sound about the same, which is very good. If you can get it for a good price, it would be a good one for your shack. If it is a choice of a used 5000 dollar and up receiver for 1000 dollars, or a new receiver for that price, I would take the used one anyday, as long as the seller is including the service manual. The reason that I mention that manual is because some of them are either impossible to get ahold of, or some entity is selling them for 300 or 400 dollars. About the only disadvantage of those high end receivers is the size. They are typically 19 inch rack mount, which is ok, but sometimes they are around 22 inches deep!

Pete

It is my understanding that there is NO provision for stopping payment on USPS money orders. Further, I seriously doubt that the post office is going to do anything at all about the problem.

Stopping payment is hardly fraud. It might be called reneging or backing out, and its not a great thing to do, but if the price of the item was logical in the first place, there will be another buyer shortly.

In any case, I doubt stopping payment works for most people as sellers of equipment wait til funds are in the bank before shipping. The best defense in a perilous field is to ask logical reasonable questions and look carefully at the answers.

I bought a Drake amp from a guy at a reasonable price last year and when it arrived, I found the power supply needed to be rebuilt (not just aging, but it had failed) I wrote back to the seller and politely noted that it seemed impossible that he could have tested the amp with that supply, etc, and would he think about refunding the $50 I had paid to cover the shipping. (to contribute towards my $100 cost of builing the supply.) His reply was that he felt terribly about it, and was sending me the full $100. So I said thank you. Not everyone is a crook, but your approach to fixing problems long distance has to be extremely polite and persistent.

4065. disable tone pad on a HM-95??

Newsgroup: rec.radio.amateur.equipment
Date: 2003-05-02 12:18:57 UTC

Anybody know how to disable (which wire to cut ect) the tone pad on the Icom HM-95 mobile mike. I keep hiting the buttons while I'm talking and I don't use them anyway so I'd like to disable but in a neat way so that it can be restored again. The rig I'm using it on is a IC-2350 dual bander.

Tnx

FT-530 Yaesu comes to mind does all that and I have seen a number
available for very reasonable prices that only need a battery.

My Yaesu hand mike has a switch, and the HT has a key sequence, to
lock out the key pad.

I don't know Icom gear, but it might be worth a journey through the
instruction manual.

I looked Gary but could find nothing in the manual for the radio unless
I missed it somewhere. Maybe some kind soul will come to my aid.
I don't have a diagram for the mike either.

Thanks

Dale

Too bad, I agree it is a very useful feature to have.

Is there a specialty Yahoo group for Icom radios, any online forums,
nearby dealer?

As others in this thread have pointed out, you have chosen a challenging task.
I presume you are a novice and unable to access the HF bands. I have never understood this requirement - I suspect the full licensees wanted to keep HF to themselves :)
I have always found the first challenge to designing radio gear is to have good test equipment to see what is going on.
In the end I have given up designing the radios and just had fun working on the test gear :))
Ideally you will have a spectrum analyser, a decent CRO and a good sig gen - say a HP8640B. I presume you dont have these
(Many of the "experts" will though - they know it is almost impossible to do serious design work without them)
Other equipment would be a multimeter, HF receiver and homebuilt units such a s a noise bridge, return loss bridge and signal source.

I suggest
as others have pointed out - adopt a building block approach, and wherever possible get rid of variables that you can control, so that you know what the final result is.
Use good design practice with lots of bypassing, short leads and ground planes so that you know the circuit will not be unstable due to these factors
Start with a current limited, regulated power supply with voltage and current readouts
Do the easy building blocks first.
For an SSB rig I would generate the SSB at HF (say 10.7 MHz for 2M) and look at the result with an HF receiver and/or CRO (it should be possible to get hold of these cheaply)
I would consider the use of surface mount components. At VHF they are much more predictable and the techniques for SM are not too hard to master.
I would consider an FM rig rather than SSB as it is probably easier to design and there are likely to be lots more people active on FM than SSB in your local area
You might be able to get a surplus FM rig that can be modified to amateur bands if you dont want to build your own.
You can reduce the RF design by using "block" filters such as helical filters which can be got from specialist suppliers.
In the end, the hard part is knowing whether your oscillator is working when you have nothing to look at it on.
Start with a reciever - you can hear local repeaters if the LO is working.

Richard
